Morphogenesis In Plants Vol 253 Molecular Approaches:

Somatic Cell Genetics and Molecular Genetics of Trees M.R. Ahuja, Wout Boerjan, David B. Neale, 2012-12-06 This proceedings is based on a joint meeting of the two IUFRO International Union of Forestry Research Organizations Working Parties Somatic Cell Genetics S2 04 07 and Molecular Genetics S2 04 06 held in Gent Belgium 26 30 September 1995 Although a joint meeting of the two Working Parties had been discussed in the past this was the first such meeting that became a successful reality In fact this meeting provided an excellent forum for discussions and interactions in forest biotechnology that encouraged the participants to vote for a next joint meeting In the past decade rapid progress has been made in the somatic cell genetics and molecular genetics of forest trees In order to cover recent developments in the broad area of biotechnology the scientific program of the meeting was divided into several sessions These included somatic embryogenesis regeneration transformation gene expression molecular markers genome mapping and biotic and abiotic stresses The regeneration of plants produced by organogenesis or somatic embryogenesis is necessary not only for mass cloning of forest trees but also for its application in genetic transformation and molecular biology Although micropropagation has been achieved from juvenile tissues in a number of forest tree species in vitro regeneration from mature trees remains a challenging problem in most hardwoods and conifers The mechanisms involved in the transition from juvenile to mature phase in woody plants are poorly understood This transition can now be investigated at the molecular level Quantitative Assessment in Epilepsy Care Harry Meinardi, Joyce A. Cramer, Gus A. Baker, Antonio Martins da Silva, 2012-12-06 Advances in epilepsy in recent decades have allowed for improved algorithms for diagnosis and a common understanding of terminology with the development of the International Classifications of Seizures and the Epilepsies Nevertheless no common system exists for the estimation of epilepsy severity or its impact on quality of life Therefore epileptologists lack the ability to make quantitative assessments of individual patients for comparison of care or for meta analyses in clinical trials This book on the Quantitative Assessment of Epilepsy Care approaches this omission by addressing the potential application of clinimetrics within the framework of epilepsy treatment Clinimetrics is a fast growing discipline concerned with the quantification of clinical symptoms with respect to decision making relating to diagnosis treatment and prognosis These methods allow for the development and validation of clinical scoring systems For example the Glasgow Coma Scale is widely used As a chronic disorder epilepsy would benefit from clinimetric methodology to create uniformity and to allow for comparisons among evaluations In addition epileptologists have not yet developed assessments of health related quality of life to define the overall condition of the chronic epilepsy patient and various therapeutic endpoints While clinical metric tools are essential for research they will also be useful in clinical practice for the care of individual patients by documenting status and changes over time This treatise will provide critical analyses of whether existing rating scales and techniques are valid to use and which types of scales and techniques require further development **Slow Potential Changes in the Human Brain** W.C.

McCallum, S.H. Curry, 2013-11-11 This volume is based on the proceedings of a NATO Advanced Research Workshop on Slow Potential Changes in the Human Brain that was held at Il Ciocco Tuscany Italy over the period 13-16th May 1990. The Workshop Director was Dr W.C. McCallum of the Burden Neurological Institute Bristol, England. The meeting was superbly organised and proved to be both stimulating and productive. On behalf of everyone who attended the meeting, I would like to thank Il Ciocco for expressing my appreciation to NATO for the provision of funding and to providing such a marvellous conference venue. I must apologise to everyone who has contributed to this volume for the length of time it has taken to produce a finished book. As you are all aware, the untimely death of Cheyne McCallum, who was to have been the sole editor of this volume, was very disruptive to both the book and myself. Following Cheyne's death, I assumed the responsibility for completing the book as was his wish. I would like to thank you all for your patience and understanding. I would like to acknowledge my indebtedness to the Burden Neurological Institute in general and very specifically to Mrs Chris Gough, who has laboured extensively in the production of this volume.

Proceedings of the Fifth International Symposium on Grapevine Physiology Ben Ami Bravdo, 2000 *Directory of Published Proceedings*, 1993 **Somatic Embryogenesis in Woody Plants** S.M. Jain, P.K. Gupta, R.J. Newton, 2013-11-11 The quality of human life has been maintained and enhanced for generations by the use of trees and their products. In recent years, ever-rising human population growth has put a tremendous pressure on trees and tree products. Growing awareness of the potential of previously unexploited tree resources and environmental pollution have both accelerated the development of new technologies for tree propagation, breeding, and improvement. Biotechnology of trees may be the answer to solve the problems which can not be solved by conventional breeding methods. The combination of biotechnology and conventional methods such as plant propagation and breeding may be a novel approach to improving and multiplying a large number of the trees and woody plants. So far, plant tissue culture technology has largely been exploited by commercial companies in propagation of ornamentals, especially foliage house plants. Generally, tissue culture of woody plants has been recalcitrant. However, limited success has been achieved in tissue culture of angiosperm and gymnosperm woody plants. A number of recent reports on somatic embryogenesis in woody plants such as Norway spruce (*Picea abies*), Loblolly pine (*Pinus taeda*), Sandalwood (*Santalum album*), Citrus mango (*Mangifera indica*) etc. offer a ray of hope of an inexpensive clonal propagation for large-scale production of plants or embryos or somatic seedlings by: a) protoplast work, b) cryopreservation, c) genetic transformation, and d) synthetic or artificial or manufactured seed production.

Thin Cell Layer Culture System: Regeneration and Transformation Applications Duong Tan Nhut, Kiem Tran Thanh Van, B. Van Le, Trevor A. Thorpe, 2013-03-09 Scientists within the field of plant biotechnology are in a constant search for techniques that can in the simplest manner possible answer the genetic and biochemical questions that underlie developmental processes. Thin Cell Layer Culture System not only takes an in-depth look at a technique that has had so much success in attempting through various practical models and systems to answer these issues but also represents a celebration

of almost 30 years of research that has covered a massive scope of plant species and areas of study. The initial studies conducted on tobacco thin cell layers (TCLs) proving that organogenesis can be strictly controlled in vitro allowed plant research to benefit from this finding, expanding this knowledge in a practical and applied manner into the biotechnological fields of tissue culture and micropropagation, cell and organ genetics and biochemistry. The chapters in this book tell the enigmatic tale of TCLs. An historical perspective opens the scene for an inquiry into the possible cellular biochemical and genetic processes that allow for the controlled development of a TCL into any organ type. The success of the system is further demonstrated in both monocotyledonous and dicotyledonous species covering successful organogenesis and in vitro flowering in species within ornamental, leguminous and wood crops, cereals and grasses. Methodologies are outlined in detail as is the rationale behind the TCL organogenesis developmental sequel. The TCL method, shown to be superior to many conventional micropropagation systems, has also shown to be vital in the recovery of transgenic plants. This book is an essential part of every plant cell and developmental biologist, geneticist and tissue culturist's shelf as it addresses the primary issue of any plant: the cell, the tissue and their subsequent development into a highly organized system.

Quality and Yield Improvement is the second of two volumes looking at the latest advances in genomic applications to crop

breeding. This volume focuses on advances improving crop resistance to abiotic stresses such as extreme heat, drought,

flooding as well as advances made in quality and yield improvement. Chapters examine advances in such key crops as rice,

maize and sugarcane among others. *Genomic Applications for Crop Breeding: Abiotic Stress Quality and Yield Improvement*

complements the earlier volume on biotic stressors and will be an essential purchase for those interested in crop science and

food production.
