## **Optical Properties Of Surfaces:**

**Optical Properties Of Surfaces** Dick Bedeaux, Jan Vlieger, 2001-12-04 This invaluable book represents a substantial body of work describing the theory of the optical properties of thin island films and rough surfaces. In both cases the feature sizes are small compared to the wavelength of light. The approach is extremely rigorous and theoretically very thorough. The reflection, transmission, and absorption of light are described. Computer programs that provide exact solutions for theoretical properties of thin island films have recently become available and this makes the book of great practical use. The early chapters provide a comprehensive theoretical framework. The electromagnetic properties of a boundary layer are described in terms of excess of the electric current, charge density, and electric and magnetic fields in Chapters 2 and 3. The reflection, transmission, and absorption of light are described in Chapter 4. Chapters 5 to 10 present a spectrum of specific island films. Spheres and spheroids with the axis of revolution normal to the substrate are treated. The region of contact is finite in both cases and the bottom of the island planar. Both the low coverage limit and finite coverage are discussed. In all cases the electromagnetic interaction with the image charge distribution in the substrate is taken into account rigorously. In Chapter 11 the theory is applied to stratified layers reproducing well known results in a simple and straightforward manner. The Green functions for the general solution of the wave equation are given in Chapter 12 and used in Chapter 13 in the derivation of the symmetry relations. The last chapter deals with rough surfaces.

Surfaces of mirrors or other optical devices employed in satellite programs will in time become contaminated with thin layers of polymer films. These films originate most likely from outgassing and polymerization by UV radiation with condensation on critical optical surfaces. The contaminant films degrade the reflectivity of mirrors and the performance of critical optical surfaces. Atomic oxygen from a high frequency plasma restores optical surfaces to their original properties by rapid non-contaminating non-destructive oxidation of the polymer film.

**The Optical Properties of Particles Deposited on a Surface**, 1994 The motivation of this research stems from the need to detect and identify small particles deposited on a plane surface that is assumed to be otherwise clean Such detection and identification is in fact relevant to all researches in which the cleanliness of the surfaces is a fundamental prerequisite and to all the applications whose purpose is the deposition on a surface of particles of a given kind In the preceding years we addressed our research toward the study of the resonances from particles on account that the resonance spectra are widely known to give useful information both for free particles and for particles on a surface Nevertheless our methods were restricted to the case of metallic surfaces because the latter are a good approximation to perfectly reflecting surfaces In this case in fact the image method proved to be very efficient to yield useful information both on the presence and of the shape of the particles of interest In the last year our interest has been directed toward the properties of particles deposited on non perfectly reflecting surfaces i e on surfaces that separate two different dielectric media Of course this new purpose of our research did not stop our study of the shape resonances from particles on metallic surfaces but our main aim has been toward the formulation of a theory applicable to particles on a surface of general dielectric properties

Structured Surfaces as Optical Metamaterials Alexei A. Maradudin, 2011 Optical metamaterials are an exciting new field in optical science A rapidly developing class of these metamaterials are those that allow the manipulation of volume and surface electromagnetic waves in desirable ways by suitably structuring the surfaces they interact with They have applications in a variety of fields such as materials science photovoltaic technology imaging and lensing beam shaping and lasing Describing techniques and applications this book is ideal for researchers and professionals working in metamaterials and plasmonics as well as those just entering this exciting new field It surveys different types of structured surfaces their design and fabrication their unusual optical properties recent experimental observations and their applications Each chapter is written by an expert in that area giving the reader an up to date overview of the subject Both the experimental and theoretical aspects of each topic are presented

**Optics and Spectroscopy at Surfaces and Interfaces** Vladimir G. Bordo, Horst-Günter Rubahn, 2005 This book covers linear and nonlinear optics as well as optical spectroscopy at solid surfaces and at interfaces between a solid and a liquid or gas In the first part the author gives a concise introduction to the physics of surfaces and interfaces They discuss in detail physical properties of solid surfaces and of their interfaces to liquid and gases The necessary theoretical background for understanding various optical techniques is provided thereafter The second part of the book gives a broad review on optical techniques and their applications such as infrared and optical spectroscopy or optical microscopy Discussions of nonlinear optics but also nano optics and local spectroscopies complement this self contained work Helpful features includes problems with solutions a glossary an index and a thoroughly elaborated list of topical references The book is suited as a text of graduate students but also for scientists working in
