The Complete Technology Book on Plastic Films, HDPE and Thermoset

Plastics NIIR Board of Consultants & Engineers,2006-01-01 Plastic Films HDPE and Thermoset Plastics are now an accepted part of the industrial and domestic scenes but this growth has been comparatively recent Plastic films are typically used for sealing food items in containers to keep them fresh over a longer period of time Plastic wrap typically sold on rolls in boxes with a cutting edge clings to many smooth surfaces and can thus remain tight over the opening of a container without adhesive or other devices The past several years have seen numerous plastic films developed for the packaging industry the most used today being polyethylene Cast polypropylene film like polyethylene film is unoriented not stretched but it was found that an improved film could be obtained by orientation stretching the cast in one or more directions Biaxial orientation is the process whereby the continuous cast film or sheet of plastic is heated up to brings it to a temperature that makes it stretchable BOPP film possesses superior tensile strength flexibility toughness shrink ability good barrier and optical characteristics The use of polyethylene terephthalate film is increasing considerably in recent years in videos audio magnetic tapes computer tapes photo and X ray films power capacitors insulation tapes and metalling for artificial zari High density polyethylene HDPE or polyethylene high density PEHD is a polyethylene thermoplastic made from petroleum The major applications of HDPE are in the manufacturing of containers pipes house wares toys filament woven sacks film wire and cable insulation HDPE is lighter than water and can be moulded machined and joined together using welding difficult to glue Thermoset or thermosetting plastics are synthetic materials that strengthen during being heated but cannot be successfully remolded or reheated after their initial heat forming This is in contrast to thermoplastics which soften when heated and harden and strengthen after cooling Thermoplastics can be heated shaped and cooled as often as necessary without causing a chemical change while thermosetting plastics will burn when heated after the initial molding Additionally thermoplastics tend to be easier to mold than thermosetting plastics which also take a longer time to produce due to the time it takes to cure the heated material Some of the astonishing fundamentals of the book are salient features of contemporary technology and current research three basic processes advances modern polyethylene processes using high yield catalysts solution polymerization processes polyolefins low density polyethylene polyvinylidene chloride PVDC vinyl chloride vinyl acetate copolymers polyvinyl acetate polyvinyl alcohol physical and chemical properties manufacturing methods extrusion of film slit die extrusion flat film extrusion comparison of blow and cast film processes water cooled polypropylene film calendaring solvent casting casting of regenerated cellulose film orientation of film expanded films plastics net from film unsaturated polyester and vinyl ester resins thermoset polyurethanes guidelines and theories in compounding polyurethane elastomers
