

# Fundamental principles of optical computing

Optical computing harnesses the light-based logic gate, a photonic circuit, and, and considers photonic structures, data processing, to replace conventional hardware of the movement of electrons.

1. Photon advantage of light; advantages of optical interconnection and processing

2. Fundamental advantage of photonic computing is bandwidth...

3. Optical data storage, photon-based optical interconnection on conventional system-level bus is the existing electronic interconnect.

4. Photons are used for computing, parallel and sequential data processing using photonic fast or slow data storage range from nanoseconds to seconds.

Hecht, 1975 The considerations in designing and calibrating a coherent optical data processing system for quantitative slope computation from a transparency with amplitude transmittances as a function of surface terrain elevations are described in this report Methods of designing the spatial filter and criteria for selecting the optical system components to minimize the errors in determining slopes are described Procedures for calibrating the input transparency and the optical system are specified Author **Introduction to Optical Data Processing** University of Michigan. Engineering Summer Conferences, 1967, 1967 **Optical Data Processing Study** Denis Hankins, 1970 An optical data processing study was performed to determine the value of the use of present day coherent optical processing techniques on selected AFFDL data processing problems Optical digital and analog implementation of Power Spectral Density Cross Spectrum Auto and Cross Correlation Transfer Function and Filtering Convolution were considered for a wide variety of input data from low frequency Clear Air Turbulence cycles hour to high frequency acoustic data 10 Hz A sample problem supplied by AFFDL was analyzed by in house optical digital and analog computers to demonstrate the degree of computational equivalence Next a study of twelve processing areas at Flight Dynamics Laboratory was performed to uncover promising areas for Optical Processing Although most requirements could be met all twelve users reported a dynamic range requirement 10 dB or more than that which is available in established optical processing technology Areas in which optical processing shows advantages over digital processing viz two dimensional Fourier transforms and high BT products were not desired nor within the current mission of the laboratory data Cost data for the three processing methods were generated For large volume processing the digital and optical implementations were found to be roughly equal and less than the cost of analog equipment for spectrum analysis The digital method is found to be system cost effective in that once a special purpose Fast Fourier Transform FTT computer is purchased to generate power spectrum and other functions can be calculated with negligible increase in cost
