Myocardial Damage:

Myocardial Damage Juan Carlos Kaski, David W. Holt, 1998-08-31 The spectrum of unstable coronary syndromes has been the object of steadily increasing research particularly in respect of novel diagnostic and treatment modalities Although the WHO criteria for the diagnosis of acute myocardial infarction have been known for decades there is still much debate as to the proper use of these especially the handling of biochemical markers Traditional enzymes have limitations in diagnostic power and new markers have unclarified applicability with regard to standardisation of assays and decision limits Furthermore the growing understanding of the conception of minimal myocardial damage in the borderzone between unstable angina pectoris and myocardial infarction necessitates refinement in the definitions of the various entities within the kaleidoscope of acute myocardial ischaemia There has been a strong impetus within the European Society of Cardiology to present this subject to a broad audience of cardiologists and as a consequence the theme of biochemical markers has become an important constituent of the Education and Training Programmes of the Society This book has fundamental implications for the overall comprehension of this complex area This book on myocardial damage compiled by international experts will truly appeal to the basic scientist as well as the clinician searching for updated knowledge of the pathophysiology and risk stratification of unstable coronary syndromes

Pathophysiology of Severe Ischemic Myocardial Injury H.M. Piper, 2012-12-06 In industrialized countries ischemic heart disease is by far the most common

organ specific cause of death The thrombotic occlusion of a coronary artery which had previously been severely altered by atherosclerosis is the most frequent cause of ischemic deterioration of myocardial tissue i e myocardial infarction Death of the human individual occurs when myocardial ischemia causes a critical impairment of cardiac pump function The failure of a heart with an ischemic area may be due to the amount and location of contractile tissue becoming paralyzed or even necrotic or to arrhythmias provoked by the ischemic condition or by a combination of both factors Considerable progress has been made in the development of antiarrhythmic therapy Effective tools have been developed to reperfuse ischemic myocardial tissue as soon as the patient reaches hospital However therapeutical principles for the ischemic reperfused myocardium which would specifically interfere with the state of injury of the ischemic tissue at the onset of reperfusion and avoid the apparent hazards of the reperfusion process itself have yet to be established But not only approved therapeutical concepts are lacking the pathophysiology of myocardial cell injury in progressive ischemia and under reperfusion is in itself only partly understood
