Reza Moheimani,2005 **Micrographics and Optical Storage Equipment Review** ,1991 *Application of FPGA to Real-Time Machine Learning* Piotr Antonik,2018-05-18 This book lies at the interface of machine learning a subfield of computer science that develops algorithms for challenging tasks such as shape or image recognition where traditional algorithms fail and photonics the physical science of light which underlies many of the optical communications technologies used in our information society It provides a thorough introduction to reservoir computing and field programmable gate arrays FPGAs Recently photonic implementations of reservoir computing a machine learning algorithm based on artificial neural networks have made a breakthrough in optical computing possible In this book the author pushes the performance of these systems significantly beyond what was achieved before By interfacing a photonic reservoir computer with a high speed electronic device an FPGA the author successfully interacts with the reservoir computer in real time allowing him to considerably expand its capabilities and range of possible applications Furthermore the author draws on his expertise in machine learning and FPGA programming to make progress on a very different problem namely the real time image analysis of optical coherence tomography for atherosclerotic arteries **Companies and Their Brands** ,2006 **California. Court of Appeal (2nd Appellate District). Records and Briefs** California (State)., **Design Automation for Optical Computing** Zheng Zhao (Ph. D.),2020 As a promising alternative to traditional CMOS circuits optics has demonstrated the ability to realize ultra high speed and low power information processing and communications For optical computing tasks including Boolean logic and neural networks however there still exist challenges such as optical power efficiency bulkiness and noise robustness To address the aforementioned issues this dissertation proposes a set of algorithms methodology and architectures for optical computing tasks which include a synthesis flow that significantly reduces the optical power loss a set of synthesis algorithms that exploits wavelength division multiplexing WDM for area efficient optical logic construction a hardware software codesign methodology that generates more area efficient and robust ONNs and an on chip integratable photonic Elman RNN architecture that empowers photonic RNNs the capability of training and tuning the state transformation for the first time For the first work we study the long neglected optical power depletion problem in previous optical boolean logic synthesis and propose graph transform techniques along with the exploitation of better optical devices to address this problem The experiments where various sources of optical power depletion are considered show the efficacy of our method of generating optical power efficient optical circuits which also helps to build a much more robust and scalable integrated photonic system In the second work we exploit a special property of light in optical logic synthesis to reduce the number of optical components The great potential of adopting WDM for efficient optical logic construction is pinpointed and a systematic synthesis flow is designed considering the practical capacity constraint Mathematically we demonstrate the affinity of the capacity constrained synthesis problem to

the hypergraph partitioning and the min cost max flow problem. The experiments show the efficiency and efficacy of our method to generate smaller optical implementations for higher optical packaging density. In the third and fourth work we focus on optical analog computing more specifically optical neuromorphic computing. We study the hardware software co design of a slimmed architecture for optical neural networks. The proposed methodology directly considers the structures and constraints of the optical hardware implementation during the software training process. The new design greatly reduces the number of optical components in the previous architecture leading to a smaller optical hardware implementation. The reduction of the cascaded optical components also brings about better robustness against device and environment related noise. In the fourth work we propose the first photonic RNN architecture realizing the widely used Elman RNN model to facilitate the applications with sequential information. To compensate for the delay variation due to manufacturing imperfections and or the environmental change we further introduce a hardware remediation mechanism along with a software training flow to selectively apply remediation to the most sensitive parts. The simulation showed we could effectively reduce the performance degradation by using the proposed flow. The effectiveness of proposed algorithms and techniques is demonstrated in this dissertation. These approaches can achieve the improvements regarding specific metrics and eventually advance the design of more compact energy efficient and robust optical computing circuits.
