## **Optical Processes In Solids:**

**Optical Processes in Solids** Yutaka Toyozawa, 2003-01-09 A unifying element that links the apparently diverse phenomena observed in optical processes is the dielectric dispersion of matter. It describes the response of matter to incoming electromagnetic waves and charged particles and thus predicts their behavior in the self-induced field of matter known as polariton and polaron effects. The energies of phonon exciton and plasmon quanta of collective motions of charged particles constituting the matter are also governed by dielectric dispersion. Since the latter is a functional of the former one can derive useful relations for their self-consistency. Nonlinear response to laser light inclusive of multiphoton processes and excitation of atomic inner shells by synchrotron radiation are also described. Within the configuration coordinate model photo-induced lattice relaxation and chemical reaction are described equally to both ground and relaxed excited states to provide a novel and global perspective on structural phase transitions and the nature of interatomic bonds. This book was first published in 2003. Nonlinear Optical Processes in Solids Anatoliĭ Stepanovich Chirkin, 1992 **Nonlinear Optical**

**Optical Interactions In Solids (2nd Edition)** Baldassare Di Bartolo, 2010-06-30 Optical Interactions in Solids presents an extensive and unified treatment of the basic principles of the optical properties of solids. It provides a theoretical background to workers in the field of laser physics and absorption and fluorescence spectroscopy of solid state materials. The book is a comprehensive coverage of the subject and is systematically and didactically organized. The level of presentation is such that it will benefit and interest both advanced students and research workers. Group theory which is useful throughout is introduced early in the book, advocating the scientific community to overcome the reluctance to employ this powerful method. Consistent emphasis is given throughout the book to the relevance of symmetry and to detailed calculations. Different subjects as various as quantum theory of radiation field, thermal vibrations of molecules and crystals and covalent bonding are brought together in a unified treatment which requires knowledge of all these topics and this points to the interpretation of the spectral properties of solids. The content of this work could be used as a two-term graduate course in solid state spectroscopy or *Higher Order Nonlinear Optics Processes in Solids and Liquids* Richard F. Begley, Stanford University.
