**1. Introduction**

This poster outlines the work on parallel object-oriented programming languages within the CoSIDE group at the Dept. of Computer Science, University College London. CoSIDE (The COOTS C++ & Solve Integrated Development Environment) is an object-oriented programming environment designed to support research in a wide range of areas. These areas include the design and implementation of parallel object-oriented programming languages (Solve and UC++), the design and implementation of user interfaces for programming environments (CogBrown) and the uses of graph models of object systems (Graphic Knowledge Interfaces). This poster concentrates on the programming languages UC++ and Solve, along with aspects of the CoSIDE environment. The work described here is being carried out as part of the COOTS project (Concurrent Object-Oriented Languages Targetting Parallel Systems), IED3/VI/1059, in collaboration with the DRA Electronics Division (Malvern) and Harlequin Ltd.

**2. The CoSIDE Environment**

CoSIDE has been developed as a common environment linking together various strands of work centring on parallel object-oriented programming. The CoSIDE implementation is designed to support:

- Multiple OO languages, coexisting within the same programming environment. Currently the languages UC++ and Solve are supported.
- Parallel programming, by providing infrastructure within which a parallel object-oriented program can run.
- Incremental compilation, by providing data structures to store information between compilations.
- Interpreted execution.
- Debugging, either of interpreted or external parallel programs.
- Re-targetable code generation for multiple target systems.
- Advanced user interface design.

**3. UC++: Parallel C++**

UC++ is a parallel version of C++, implemented as an extension of the semantics of C++, adding the concept of Active Object. Each Active Object is associated with a virtual processor and may (potentially) execute member functions in parallel with other active objects. Active objects may be created either statically or dynamically.

**Handbook of Software Engineering** Sungdeok Cha,Richard N. Taylor,Kyochul Kang,2019-02-11 This handbook provides a unique and in depth survey of the current state of the art in software engineering covering its major topics the conceptual genealogy of each subfield and discussing future research directions Subjects include foundational areas of software engineering e g software processes requirements engineering software architecture software testing formal methods software maintenance as well as emerging areas e g self adaptive systems software engineering in the cloud coordination technology Each chapter includes an introduction to central concepts and principles a guided tour of seminal papers and key contributions and promising future research directions The authors of the individual chapters are all acknowledged experts in their field and include many who have pioneered the techniques and technologies discussed Readers will find an authoritative and concise review of each subject and will also learn how software engineering technologies have evolved and are likely to develop in the years to come This book will be especially useful for researchers who are new to software engineering and for practitioners seeking to enhance their skills and knowledge

**OOPSLA '92 ,1993 Just Enough Software Architecture** George Fairbanks,2010-08-30 This is a practical guide for software developers and different than other software architecture books Here s why It teaches risk driven architecting There is no need for meticulous designs when risks are small nor any excuse for sloppy designs when risks threaten your success This book describes a way to do just enough architecture It avoids the one size fits all process tar pit with advice on how to tune your design effort based on the risks you face It democratizes architecture This book seeks to make architecture relevant to all software developers Developers need to understand how to use constraints as guiderails that ensure desired outcomes and how seemingly small changes can affect a system s properties It cultivates declarative knowledge There is a difference between being able to hit a ball and knowing why you are able to hit it what psychologists refer to as procedural knowledge versus declarative knowledge This book will make you more aware of what you have been doing and provide names for the concepts It emphasizes the engineering This book focuses on the technical parts of software development and what developers do to ensure the system works not job titles or processes It shows you how to build models and analyze

architectures so that you can make principled design tradeoffs. It describes the techniques software designers use to reason about medium to large sized problems and points out where you can learn specialized techniques in more detail. It provides practical advice. Software design decisions influence the architecture and vice versa. The approach in this book embraces drill down pop up behavior by describing models that have various levels of abstraction from architecture to data structure design.

Software Engineering for Variability Intensive Systems Ivan Mistrik, Matthias Galster, Bruce R. Maxim, 2019-01-15. This book addresses the challenges in the software engineering of variability intensive systems. Variability intensive systems can support different usage scenarios by accommodating different and unforeseen features and qualities. The book features academic and industrial contributions that discuss the challenges in developing, maintaining and evolving systems, cloud and mobile services for variability intensive software systems and the scalability requirements they imply. The book explores software engineering approaches that can efficiently deal with variability intensive systems as well as applications and use cases benefiting from variability intensive systems. **Software Pioneers** Manfred Broy, Ernst Denert, 2012-12-06. A lucid statement of the philosophy of modular programming can be found in a 1970 textbook on the design of system programs by Gouthier and Pont 1 1 Cf10 23 which we quote below. A well defined segmentation of the project effort ensures system modularity. Each task forms a separate distinct program module. At implementation time each module and its inputs and outputs are well defined. There is no confusion in the intended interface with other system modules. At checkout time the integrity of the module is tested independently. There are few scheduling problems in synchronizing the completion of several tasks before checkout can begin. Finally the system is maintained in modular fashion. System errors and deficiencies can be traced to specific system modules thus limiting the scope of detailed error searching. Usually nothing is said about the criteria to be used in dividing the system into modules. This paper will discuss that issue and by means of examples suggest some criteria which can be used in decomposing a system into modules. A Brief Status Report. The major advancement in the area of modular programming has been the development of coding techniques and assemblers which 1 allow one module to be written with little knowledge of the code in another module and 2 allow modules to be reassembled and replaced without reassembly of the whole system. A Reactive Approach to Comprehensive Global Garbage Detection Sylvain R. Louboutin, 1999-02. Comprehensive global garbage detection GGD in object oriented distributed systems i.e. GGD intrinsically able to detect distributed cycles of garbage has mostly been addressed via graph tracing algorithms. Graph tracing algorithms must account for every live object in the system before any resource can actually be reclaimed which compromises both their scalability and robustness in a distributed environment. Alternative non comprehensive approaches trade off comprehensiveness for scalability and robustness under the assumptions that distributed cycles of garbage are rare and that all comprehensive algorithms are

necessarily unscalable This thesis contends instead that distributed cycles of garbage are as likely to occur as local cycles and that a comprehensive alternative to graph tracing GGD is possible From the GGD perspective the combined effects of the application processes and local garbage collectors fulfill the role of a global mutator A subset of events of this global mutator's computation called log keeping events reflect either the creation or the destruction of inter site paths in the global object graph The causal history of a log keeping event corresponds to the set of events responsible for the creation of all the paths ever created that are incident to an object The path history of this event is defined as a subset of its causal history and contains only those events responsible for the creation of the extant paths to this object This dissertation presents a novel approach to comprehensive GGD that entails computing dependency vectors which characterize the path history of log keeping events that reflect the destruction of a path These dependency vectors can be computed by propagating increasingly accurate approximations of these vectors along the paths of the global object graph In effect this algorithm reacts to events that may result in the creation of garbage and identifies garbage without requiring a complete scan of the whole object graph In conjunction with a lazy log keeping mechanism it can therefore be shown to be both scalable and robust despite being comprehensive     *Proceedings of the ...
