**Spatial Data Science** Edzer Pebesma,Roger Bivand,2023-05-10 Spatial Data Science introduces fundamental aspects of spatial data that every data scientist should know before they start working with spatial data These aspects include how geometries are represented coordinate reference systems projections datums the fact that the Earth is round and its consequences for analysis and how attributes of geometries can relate to geometries In the second part of the book these concepts are illustrated with data science examples using the R language In the third part statistical modelling approaches are demonstrated using real world data examples

After reading this book the reader will be well equipped to avoid a number of major spatial data analysis errors. The book gives a detailed explanation of the core spatial software packages for R: sf for simple feature access and stars for raster and vector data cubes; array data with spatial and temporal dimensions. It also shows how geometrical operations change when going from a flat space to the surface of a sphere which is what sf and stars use when coordinates are not projected degrees longitude/latitude. Separate chapters detail a variety of plotting approaches for spatial maps using R and different ways of handling very large vector or raster imagery datasets locally in databases or in the cloud. The data used and all code examples are freely available online from <https://r-spatial.org/book>. The solutions to the exercises can be found here [https://edzer.github.io/sdsr\\_exercises](https://edzer.github.io/sdsr_exercises).

*Hierarchical Modeling and Analysis for Spatial Data* Sudipto Banerjee, Alan E. Gelfand, Bradley P. Carlin, 2025-09-23. Hierarchical Modeling and Analysis for Spatial Data, Third Edition is the latest edition of this popular and authoritative text on Bayesian modeling and inference for spatial and spatio-temporal data. The text presents a comprehensive and up-to-date treatment of hierarchical and multilevel modeling for spatial and spatio-temporal data within a Bayesian framework. Over the past decade since the second edition, spatial statistics has evolved significantly, driven by an explosion in data availability and advances in Bayesian computation. This edition reflects those changes, introducing new methods, expanded applications, and enhanced computational resources to support researchers and practitioners across disciplines, including environmental science, ecology, and public health. Key features of the third edition include:

- A dedicated chapter on state-of-the-art Bayesian modeling of large spatial and spatio-temporal datasets.
- Two new chapters on spatial point pattern analysis, covering both foundational and Bayesian perspectives.
- A new chapter on spatial data fusion, integrating diverse spatial data sources from different probabilistic mechanisms.
- An accessible introduction to GPS mapping, geodesic distances, and mathematical cartography.
- An expanded special topics chapter including spatial challenges with finite population modeling and spatial directional data.
- A thoroughly revised chapter on Bayesian inference, featuring an updated review of modern computational techniques.
- A dedicated GitHub repository providing R programs and solutions to selected exercises, ensuring continued access to evolving software developments.

With refreshed content throughout, this edition serves as an essential reference for statisticians, data scientists, and researchers working with spatial data. Graduate students and professionals seeking a deep understanding of Bayesian spatial modeling will find this volume an invaluable resource for both theory and practice.
