Introduction to Materials Science Jean-Pierre Mercier, Gérald Zambelli, Wilfried Kurz, 2002. The approach of this concise but comprehensive introduction covering all major classes of materials is right for not just materials science students and professionals but also for those in engineering, physics and chemistry or other related disciplines. The characteristics of all main classes of materials: metals, polymers and ceramics are explained with reference to real world examples. So each class of material is described then its properties are explained with illustrative examples from the leading edge of application. This edition contains new material on nanomaterials and nanostructures and includes a study of degradation and corrosion and a presentation of the main organic composite materials. Illustrative examples include carbon fibres, the silicon crystal, metallic glasses and diamond films. Applications explored include ultra light aircraft, contact lenses, dental materials, single crystal blades for gas turbines, use of lasers in the automotive industry, cables for cable cars.

permanent magnets and molecular electronic devices covers latest materials including nanomaterials and nanostructures real world case studies bring the theory to life and illustrate the latest in good design all major classes of materials are covered in this concise yet comprehensive volume
