## **Maternal Nutrition And Pregnancy Outcome:**

**Maternal Nutrition and Pregnancy Outcome** Carl L. Keen, Adrienne Bendich, Calvin C. Willhite, 1993 This work presents current information on the mechanisms underlying the role of specific nutrients in prenatal development the influence of nutrient deficiencies and toxicities on prenatal development in experimental models and the influence of maternal nutritional status on pregnancy outcome in human populations Recent data concerning the effects of folate supplementation on the occurrences of neural tube defects are discussed in detail as one example of how interactions among maternal genetics and environmental factors influence pregnancy outcome The Role of Pregnancy Nutrition in Maternal and Offspring Health Ekaterina Maslova, 2019-12-03 In pregnancy maternal nutrition sustains and nourishes the developing child Imbalances in either the direction of nutritional excess or deficiency can have adverse consequences for child health In addition more research now suggests that good pregnancy nutrition influences child health beyond pregnancy and delivery This includes modifying the risk of child health outcomes as they enter childhood and adulthood through influences on placental development hormonal pathways and organ structure and function Poor pregnancy nutrition may also compromise maternal health during pregnancy which may have long term consequences for women s health Understanding the biological and social mechanisms operating during pregnancy can help in the design of better clinical and public health interventions This Special Issue on The Role of Pregnancy Nutrition in Maternal and Offspring Health includes etiological and mechanistic studies of pregnancy nutrition with short and long term maternal and child health outcomes including original research narrative reviews and systematic reviews and meta analyses Together this body of work provides important insights into the influence of dietary patterns food groups and nutrients on pregnancy outcomes and long term neurodevelopmental respiratory and metabolic health in the children It also highlights nutritional consequences for specific groups of women including those with pregnancy complications and eating disorders *Nutrition in Pregnancy*, 2017-04-21 Maternal nutrition during pregnancy is of considerable interest to women their partners and their health care professionals In developing countries maternal undernutrition is a major concern However with the increased prevalence of abundant high calorie diets their impact upon pregnancy outcome is of concern In addition to the amount of nutrition available and its macronutrient composition within a diet there is emerging evidence highlighting important roles for the lesser studied micronutrients Added to this complexity is the distinction between maternal and fetal nutrition and the impact the placenta plays in nutrient metabolism and overall nutrient supply to the fetus Together these many variables contribute to placental development and function fetal growth and where placental fetal nutrition and growth is compromised through poor maternal diet and or diet induced alterations in placental metabolism the impact is dramatic and can lead to lifelong implications for the offspring This Special Issue book aims to highlight research in many of these areas *Nutrition, Immunity and Infection* Prakash S. Shetty, 2010 Infectious diseases are an important cause of malnutrition Recurrent

infections increase the risk of malnutrition while poor nutritional status results in lowered immune status and predisposes to infectious disease thus propagating the vicious cycle of infection and malnutrition The nutrition infection immunity axis is crucial for both developed and developing countries and is now a central feature of many nutrition and infectious disease courses Bringing together nutrition and immunology Nutrition Immunity and Infections covers the topic in an accessible format for all students

extent to which vitamin D per se contributes to these positive effects is an area of considerable debate. It is clear that well designed large scale randomized clinical trials are needed to determine the effects of maternal vitamin D status on pregnancy and infant outcomes. One component of my dissertation research was a published review of vitamin D supplementation and pregnancy outcome. Fetal Alcohol Spectrum Disorder (FASD) characterizes some infants born to women who consume alcohol during pregnancy. FASD, which can include facial dysmorphism, growth retardation, and neurobehavioral deficits, is a leading cause of cognitive impairment worldwide. Thus, it is crucial to identify factors that can impact the risk for FASD. My dissertation research was focused on an investigation of two such factors: maternal fatty acid profiles and maternal immune function. Using a Ukrainian population of alcohol consuming mothers, in the first study I examined the relationship of maternal alcohol consumption on third trimester maternal plasma polyunsaturated fatty acid composition and their association with FASD in the offspring. Third trimester plasma docosahexanoic acid (DHA, C22:6n3) and total omega-3 fatty acids, expressed as both concentration and the percent of total fatty acids, were negatively associated with alcohol intakes around conception and enrollment (average 19 weeks gestation). Plasma composition of omega-6 fatty acids were altered in mothers with FASD infants. Specifically, arachidonic acid (AA, C20:4n6) and docosapentaenoic acid (DPA, C22:5n3) were significantly higher in mothers with FASD infants than in either controls or alcohol exposed mothers with typically developing infants. These results provide support that maternal fatty acid status may play a role in the etiology of FASD. During pregnancy, the maternal immune system participates in both pro and anti-inflammatory responses prompted by synergistic interactions between both maternal and fetal tissues to allow fetal acceptance and protect the mother from infection. It has been a prominent theory that immune dysfunction during pregnancy is a contributing factor to miscarriages and neurodevelopmental disorders, including autism spectrum disorder and schizophrenia. Given that alcohol alters immune response, leading to both pro-inflammatory response and diminished immune function, in the second study I investigated the association of maternal cytokine levels in early/mid 26 weeks gestation and late pregnancy (26 weeks gestation) in our population of Ukrainian mothers on neurobehavioral development and risk for FASD in their offspring. Neurobehavioral testing (Bayley Scales of Infant Development) was administered to alcohol exposed and alcohol unexposed infants at six and twelve months. I examined whether the resulting standardized mental development scores (MDI) and psychomotor development scores (PDI) were associated with maternal cytokine levels. Increases in the ratio of maternal TNF:alpha:IL-10 and IL-6:IL-10 in late pregnancy were negatively associated with MDI scores at twelve months and PDI scores at both time points. A reduction in the odds ratio of having an FASD child was observed with increasing levels of IL-1:beta:IL-2, IL-4, IL-6, and IL-10 in early pregnancy, and IL-1:beta and IL-10 during late pregnancy. However, subjects that did not increase IL-10 levels in the third trimester in order to maintain the balance of pro and anti-inflammatory cytokines had an elevated risk of having a child with FASD, with a significant increase in the odds ratio of FASD with increasing ratios of late pregnancy TNF:

alpha IL 10 levels These data support the concept that in alcohol consuming women disruptions in immune response more notably the balance between pro and anti inflammatory cytokines can contribute to neurobehavioral impairment and an increased risk of FASD These data support the implication that maternal nutrition and immune function are contributing factors in FASD and neurobehavioral impairment in alcohol exposed infants Future studies to determine the mechanisms involved in the both the individual and interdependent roles of maternal nutrition and immune function are needed With this knowledge more specialized nutritional interventions for the prevention and or treatment of FASD can be developed
