Abstract Multipurpose operation is adopted by most reservoirs in Taiwan in order to maximize the benefits of power generation, water supply, irrigation and recreational purposes. A multiobjective approach can be used to obtain trade-off curves among these multipurpose targets. The weighting method, in which different weighting factors are used for different purposes, was used in this research work. In Taiwan, most major reservoirs are operated by rule curves. Genetic algorithms with characteristics of artificial intelligence were applied to obtain the optimal rule curves of the multi-reservoir system under multipurpose operation in Chou-Shui River Basin in central Taiwan. The model results reveal that different shapes of rule curves under different weighting factors on targets can be efficiently obtained by genetic algorithms. Pareto optimal solutions for a trade-off between water supply and hydropower were obtained and analyzed.

Introduction

The study of genetic algorithms (GAs) was originated by Holland (1975). GAs have been developed to become a powerful optimization approach. In the theory of GAs, Brindle (1981) improved the roulette wheel selection; Wright (1991) and Eshelman *et al.* (1992) developed real-value coding to solve related problems. GAs were applied to water resources systems by Goldberg and Kuo (1987) for pipeline optimization. Wang (1991) applied GAs to the calibration of a conceptual rainfall-runoff model. McKinney and Lin (1994), Ritzel *et al.* (1994), and Cieniawski *et al.* (1995) solved ground-water problems with GAs.

So far, there have been very few applications of GAs to reservoir systems optimization. East and Hall (1994) applied GAs to a four-reservoir problem; the objective was to maximize the benefits from power generation, irrigation and water supply. Fahmy *et al.* (1994) also applied GAs to a reservoir system, and compared the performance of the GAs with dynamic programming. Oliveira and Loucks (1997) used GAs to evaluate operating rules for a multi-reservoir system. Chang and Chen (1998) applied a GA to solve a flood control operation problem. Sharif and Wardlaw (2000) used GAs to solve a multi-reservoir system optimization problem in Brantas Basin located in Indonesia.

This research uses GAs for obtaining optimal rule curves in a reservoir system operation and finds the Pareto optimal solutions for water supply and hydropower generation in Chou-Shui River Basin in central Taiwan.

Mades, George Tauxe, 1980 Multicriteria Optimization in Engineering and in the Sciences Wolfram Stadler, 2013-12-14 We are rarely asked to make decisions based on only one criterion most often decisions are based on several usually conflicting criteria In nature if the design of a system evolves to some final optimal state then it must include a balance for the interaction of the system with its surroundings certainly a design based on a variety of criteria Furthermore the diversity of nature s designs suggests an infinity of such optimal states In another sense decisions simultaneously optimize a finite number of criteria while there is usually an infinity of optimal solutions Multicriteria optimization provides the mathematical framework to accommodate these demands Multicriteria optimization has its roots in mathematical economics in particular in consumer

economics as considered by Edgeworth and Pareto The critical question in an exchange economy concerns the equilibrium point at which each of N consumers has achieved the best possible deal for himself or herself Ultimately this is a collective decision in which any further gain by one consumer can occur only at the expense of at least one other consumer Such an equilibrium concept was first introduced by Edgeworth in 1881 in his book on mathematical psychics Today such an optimum is variously called Pareto optimum after the Italian French welfare economist who continued and expanded Edgeworth's work efficient nondominated and so on
