Multivariate Exploratory Data Analysis:

Exploratory and Multivariate Data Analysis Michel Jambu,1991-09-09 With a useful index of notations at the beginning this book explains and illustrates the theory and application of data analysis methods from univariate to multidimensional and how to learn and use them efficiently This book is well illustrated and is a useful and well documented review of the most important data analysis techniques Describes in detail exploratory data analysis techniques from the univariate to the multivariate ones Features a complete description of correspondence analysis and factor analysis techniques as multidimensional statistical data analysis techniques illustrated with concrete and understandable examples Includes a modern and up to date description of clustering algorithms with many properties which gives a new role of clustering in data analysis techniques

Exploratory Multivariate Analysis by Example Using R Francois Husson,Sebastien Le,Jérôme Pagès,2010-11-15 Full of real world case studies and practical advice Exploratory Multivariate Analysis by Example Using R focuses on four fundamental methods of multivariate exploratory data analysis that are most suitable for applications It covers principal component analysis PCA when variables are quantitative correspondence analysis CA and multiple correspondence analysis MCA when variables are categorical and hierarchical cluster analysis The authors take a geometric point of view that provides a unified vision for exploring multivariate data tables Within this framework they present the principles indicators and ways of representing and visualizing objects that are common to the exploratory methods The authors show how to use categorical variables in a PCA context in which variables are quantitative how to handle more than two categorical variables in a CA context in which there are originally two variables and how to add quantitative variables in an MCA context in which variables are categorical They also illustrate the methods and the ways they can be exploited using examples from various fields Throughout the text each result correlates with an R command accessible in the FactoMineR package developed by the authors All of the data sets and code are available at <http://factominer.free.fr> book By using the theory examples and software presented in this book readers will be fully equipped to tackle real life multivariate data

Solka,2004-11-29 Exploratory data analysis EDA was conceived at a time when computers were not widely used and thus computational ability was rather limited As computational sophistication has increased EDA has become an even more powerful process for visualizing and summarizing data before making model assumptions to generate hypotheses encompassing larger and more complex data sets There are many resources for those interested in the theory of EDA but this is the first book to use MATLAB to illustrate the computational aspects of this discipline Exploratory Data Analysis with MATLAB presents the methods of EDA from a computational perspective The authors extensively use MATLAB code and algorithm descriptions to provide state of the art techniques for finding patterns and structure in data Addressing theory they also incorporate many annotated references to direct readers to the more theoretical aspects of the methods The book presents an approach using the basic functions from MATLAB and the MATLAB Statistics Toolbox in order to be more accessible and enduring It also contains pseudo code to enable users of other software packages to implement the algorithms This text places the tools needed to implement EDA theory at the fingertips of researchers applied mathematicians computer scientists engineers and statisticians by using a practical computational approach *Exploratory Analysis of Multivariate*

foods Nevertheless statistical methods are most often associated with engineering mathematics and the medical sciences and are rarely thought to be driven by food science Consequently there is a dearth of statistical methods aimed specifically at food science forcing researchers to utilize methods intended for other disciplines The objective of this Brief will be to highlight the most needed and relevant statistical methods in food science and thus eliminate the need to learn about these methods from other fields All methods and their applications will be illustrated with examples from research literature

Statistics Thomas Hill, Paweł Lewicki, 2006 This one of a kind book offers a comprehensive almost encyclopedic presentation of statistical methods and analytic approaches used in science industry business and data mining written from the perspective of the real life practitioner consumer of these methods *Multivariate Exploratory Data Analysis of Spatial Data to Support Geostatistical Modeling* Haoze Zhang, 2021 Geostatistical modeling takes geological data as inputs and builds statistical models for resource prediction Geostatistics consists of several components including preprocessing modeling and postprocessing Exploratory data analysis EDA is an early step in preprocessing It provides the characteristics of data and helps identify erroneous or inconsistent data In the context of geostatistics missing data and below detection limit BDL data are an important anomaly to be understood in EDA Missing data are problematic in EDA techniques such as principal component analysis PCA BDL data also cause problems when conducting cluster analysis and other analysis Geostatistical models need to be conducted in stationary domains so multivariate and spatial cluster analysis is another important aspect in EDA It separates data into smaller groups in which data share similar features This thesis covers multiple aspects of geostatistical EDA A data map examines missing data and it shows the number of missing data in each variable and location A combined permutation and Kolmogorov Smirnov KS test identify if the missingness in variables is systematic BDL data are investigated in univariate and bivariate methods A BDL statistics table complements histograms Three methods measure the spikiness of data Bivariate analysis compares observed distributions with expected distributions which indicate full independence of BDL occurrence Kullback Leibler KL test quantifies the difference between the distributions obtaining combinations of variables in which the BDL occurrence can be dependent This helps the understanding of the reasons for BDL data The handling of BDL data in cluster analysis is addressed including a workflow that finds the optimal number of clusters Tests on synthetic data examine the compatibility of the workflow with different data transformations and clustering methods K means is a suitable clustering method for dealing with BDL spikes Four transformations compatible with the workflow are combined with k means to examine clusters in real data The trade off between spatial continuity and multivariate continuity in cluster analysis is addressed A novel classification method is proposed to find the optimal clustering and domain labels Ensemble clustering labels are used as inputs for the classification The classification algorithm takes multiple sets of clustering labels as inputs The domains are assigned based on clustering labels and two hyperparameters spatial weight and number of domains The matrix of classification results shows higher

spatial weight results in more continuous domains Flow simulation results show that the domain label assignment has an impact on the performance of the final geostatistical models because flow responses are highly sensitive to spatial and multivariate continuity Conversational Explanatory Data Analysis Gerald L. Exploratory Multivariate Longitudinal Data Analysis and Models for Multivariate Longitudinal Binary Data Ozlem Ilk,2004 Longitudinal data occurs when repeated measurements from the same subject are observed over time In this thesis exploratory data analysis and models are utilized jointly to analyze longitudinal data which leads to stronger and better justified conclusions The complex structure of longitudinal data with covariates requires new visual methods that enable interactive exploration Here we catalog the general principles of exploratory data analysis for multivariate longitudinal data and illustrate the use of the linked brushing approach for studying the mean structure over time It is possible to reveal the unexpected to explore the interaction between responses and covariates to observe the individual variations understand structure in multiple dimensions and diagnose and fix models by using these methods We also propose models for multivariate longitudinal binary data that directly model marginal covariate effects while accounting for the dependence

across time via a transition structure and across responses within a subject for a given time via random effects Markov Chain Monte Carlo Methods specifically Gibbs sampling with Hybrid steps are used to sample from the posterior distribution of parameters Graphical and quantitative checks are used to assess model fit The methods are illustrated on several real datasets primarily the Iowa Youth and Families Project
