

## PRE MACROPROCESSORS

### Macro Instruction definition and expansion:

#### \* MACRO

- a macro notation is a <sup>notational</sup> ~~conventional~~ convention for the programmers
- it allows programmers to write shorthand version of a program (macro programming)
- the macro processor replaces each macro invocation with corresponding sequence of statements (expanding)

#### \* macro vs subroutine

macro - statements of expansion are generated each time macro are invoked

subroutine - statement in a subroutine appears only once

#### \* roles do of macroprocessor

- macro definition
- macro expansion
- macro invocation

*Energy Efficient Microprocessor Design* Thomas D. Burd,Robert W. Brodersen,2012-12-06 This work began in 1995 as an outgrowth of the InfoPad project which showed us that in order to reduce the energy consumption of a portable multimedia terminal that something had to be done about the consumption of the microprocessor subsystem The design of the InfoPad attempted to reduce the requirements of this general purpose processor by moving the computation into the network or by the use of highly optimized integrated circuits but in spite of these efforts it still was a major consumer of energy The reasons for this became apparent as we determined that the energy required to perform a function in dedicated hardware could be several orders of magnitude lower than that consumed in the InfoPad microprocessor We therefore set out on a full fledged attack on all aspects of the microprocessor energy consumption 1 J After considerable analysis it became clear that though better circuit design and a stream lined architecture would assist in our goal of energy reduction that the biggest gains were to be found by operating at reduced voltages For the busses and VO this could be accomplished without significant degradation of the processor performance but this was not a straightforward solution when applied to the core of the processor sub system CPU and memory

**High-Performance Energy-Efficient Microprocessor Design** Vojin G. Oklobdzija,Ram K. Krishnamurthy,2007-04-27 Microprocessors of today contain close to a billion transistors while achieving the performance of super computers just a decade ago Designing such processors takes hundreds of people organized into large teams High Performance Energy Efficient Microprocessor Design is written by the world's most prominent microprocessor design leaders from the industry and academia It provides a complete coverage of all the aspects of a complex microprocessor design process from technology power management clocking high performance architecture design methodologies memory

and I/O design computer aided design testing and design for testability. The chapters are written to provide the latest state of the art knowledge of particular aspects of microprocessor design while including sufficient tutorial content in order to bring non-experts up to speed. *High Performance Energy Efficient Microprocessor Design* is intended to be a useful companion book for every design engineer working in the related areas and a source of technical information as well as a comprehensive reference in the field. It should also serve as the source book for technical and business managers involved in microprocessor based design and manufacture. The chapters are organized in a way which makes it possible to use this book as a textbook for graduate courses in advanced digital and system design. The book is intended to highlight practical problems encountered in designing state of the art processors while yet covering fundamental principles that are independent of technology.

**Microprocessor Systems**, 1977    **Fundamentals of Information Technology** Graeme G. Wilkinson, Anthony R. Winterflood, 1987. Explores the important developments in the software field and provides a thorough study of formal methods in software design, information management systems, intelligent knowledge based systems and human machine interfaces. The book aims to tackle this hybrid subject logically and clearly.

**Software Design Strategies** Glenn D. Bergland, Ronald D. Gordon, 1981    **Low-Power Processors and Systems on Chips** Christian Piguet, 2018-10-03. The power consumption of microprocessors is one of the most important challenges of high performance chips and portable devices. In chapters drawn from Piguet's recently published *Low Power Electronics Design* this volume addresses the design of low power microprocessors in deep submicron technologies. It provides a focused reference for specialists involved in systems on chips from low power microprocessors to DSP cores, reconfigurable processors, memories, ad hoc networks and embedded software.

**Low Power Processors and Systems on Chips** is organized into three broad sections for convenient access. The first section examines the design of digital signal processors for embedded applications and techniques for reducing dynamic and static power at the electrical and system levels. The second part describes several aspects of low power systems on chips including hardware and embedded software aspects, efficient data storage, networks on chips and applications such as routing strategies in wireless, RF sensing and actuating devices. The final section discusses embedded software issues including details on compilers, retargetable compilers and verification tools. Providing detailed examinations contributed by leading experts, *Low Power Processors and Systems on Chips* supplies authoritative information on how to maintain high performance while lowering power consumption in modern processors and SoCs. It is a must read for anyone designing modern computers or embedded systems.
