During the last decade essential progress has been achieved in the analysis and implementation of multilevel multigrid and domain decomposition methods to explore a variety of real world applications An important trend in modern numerical simulations is the quick improvement of computer technology that leads to the well known paradigm see e.g. 78-179 high performance computers make it indispensable to use numerical methods of almost linear complexity in the problem size  $N$  to maintain an adequate scaling between the computing time and improved computer facilities as  $N$  increases In the  $h$  version of the finite element method FEM the multigrid iteration realizes an  $O(N)$  solver for elliptic differential equations in a domain  $\Omega \subset \mathbb{R}^d$  with  $N = O(h^{-d})$  where  $h$  is the mesh parameter In the boundary element method BEM the traditional panel clustering fast multipole and wavelet based methods as well as the modern hierarchical matrix techniques are known to provide the data sparse approximations to the arising fully populated stiffness matrices with almost linear cost  $O(Nr \log Nr)$  where  $1 \leq Nr = O(h^{-1})$  is the number of degrees of freedom associated with the boundary The aim of this book is to introduce a wider audience to the use of a new class of efficient numerical methods of almost linear complexity for solving elliptic partial differential equations PDEs based on their reduction to the interface
