## **Modern Geometric Computing For Visualization:**

Modern Geometric Computing for Visualization Toshiyasu L. Kunii, Yoshihisa Shinagawa, 2012-12-06 This volume is on modern geometric computing for visualization which is at the forefront of multi disciplinary advanced research areas. This area is attracting intensive research interest across many application fields: singularity in cosmology, turbulence in ocean engineering, high energy physics, molecular dynamics, environmental problems, modern mathematics, computer graphics, and pattern recognition. Visualization requires the computation of displayable shapes which are becoming more and more complex in proportion to the complexity of the objects and phenomena visualized. Fast computation requires information locality. Attaining information locality is achieved through characterizing the shapes in geometry and topology and the large amount of computation required through the use of supercomputers. This volume contains the initial results of our efforts to satisfy these requirements by inviting experts and selecting new research works through review processes. To be more specific, this book presents the proceedings of the International Workshop on Modern Geometric Computing for Visualization held at Kogakuin University, Tokyo, Japan, June 29-30, 1992, organized by the Computer Graphics Society Japan, Personal Computer Software Association, Kogakuin University, and the Department of Information Science, Faculty of Science, The University of Tokyo. We received extremely high quality papers for review from five different countries: one from Australia, one from Italy, four from Japan, one from Singapore, and three from the United States. We accepted eight papers and rejected two.
