Mobile Computation With Functions:

Mobile Computation with Functions Zeliha Dilsun Kirli, 2012-12-06 Mobile Computation with Functions explores distributed computation with languages which adopt functions as the main programming abstraction and support code mobility through the mobility of functions between remote sites. It aims to highlight the benefits of using languages of this family in dealing with the challenges of mobile computation. The possibility of exploiting existing static analysis techniques suggests that having functions at the core of mobile code language is a particularly apt choice. A range of problems which have impact on the safety, security and performance are discussed. It is shown that types extended with effects and other annotations can capture a significant amount of information about the dynamic behavior of mobile functions and offer solutions to the problems under investigation. This book includes a survey of the languages Concurrent ML, Facile and PLAN which inherit the strengths of the functional paradigm in the context of concurrent and distributed computation. The languages which are defined in the subsequent chapters have their roots in these languages.

Mobile Computation with Functions Zeliha Dilsun Kirli, 2002 The practice of computing has reached a stage where computers are seen as parts of a global computing platform. The possibility of exploiting resources on a global scale has given rise to a new paradigm: the mobile computation paradigm for computation in large scale distributed networks. Languages which enable the mobility of code over the network are becoming widely used for building distributed applications. This thesis explores distributed computation with languages which adopt functions as the main programming abstraction and support code mobility through the mobility of functions between remote sites. It aims to highlight the benefits of using languages of this family in dealing with the challenges of mobile computation. The possibility of exploiting existing static analysis techniques suggests that having functions at the core of a mobile code language is a particularly apt choice. A range of problems which have impact on the safety, security and performance of systems are discussed here. It is shown that types extended with effects and other annotations can capture a significant amount of information about the dynamic behaviour of mobile functions and offer solutions to the problems under investigation. The thesis presents a survey of the languages Concurrent ML, Facile and PLAN which remain loyal to the principles of the functional language ML and hence inherit its strengths in the context of concurrent and distributed computation. The languages which are defined in the subsequent chapters have their roots in these languages. Two chapters focus on using types to statically predict whether functions are used locally or may become mobile at runtime. Types are exploited for distributed calltracking to estimate which functions are invoked at which sites in the system. Compilers for mobile code languages would benefit from such estimates in dealing with the heterogeneity of the network nodes in providing static profiling tools and in estimating the resource consumption of programs. Two chapters are devoted to the use of types in controlling the flow of values in a system where users have different trust levels. The confinement of values within a specified mobility region is the subject of one of these. The other focuses on systems where

values are classified with respect to their confidentiality level The sources of undesirable flows of information are identified and a solution based on noninterference is proposed

portable computers have become available on the marketplace There is demand for such computers termed walkstations to access network services while retaining their mobility and to operate effectively in a wide range of conditions Future office environments are expected to support wireless networks with bandwidths which are several orders of magnitude greater than are available outdoors In such environments there will be powerful compute servers available for a walkstation s use This dissertation describes a novel architecture called Notus and its support for applications operating in a mobile environment The concept of the traded handoff is introduced where applications are able to participate in the handoff process rebuilding connections to the most appropriate service This is expected to benefit walkstations which roam over large distances where connections to servers would otherwise be strained and also between heterogeneous networks where cooperation between the networks in performing a handoff might be problematic It is also proposed in this dissertation that applications could benefit from the ability to migrate onto compute servers as a walkstation moves into the office environment This enables both the walkstation to conserve its own resources and applications to improve the service provided to the end user Finally by interleaving a traded handoff with the migration process it is possible for a migrating application to easily rebuild its connections as it moves to a new host The Notus architecture has been implemented including a traded handoff service and a new application migration service The new application migration service was designed since existing application migration services are unsuited to mobile environments and it enables applications to migrate between heterogeneous hosts with little disruption Applications which use the service are written in a standard compiled language and normal running applications suffer little overhead A number of existing applications which are representative of a walkstation s interactive desk top environment have been adapted to use the Notus architecture and are evaluated In summary this work describes how mobility awareness and the support from appropriate tools can enable walkstation applications to better adapt to a changing mobile environment particularly when the walkstation is carried between different network types or over great distances
