*Model Categories and Their Localizations* Philip S. Hirschhorn, 2003 The aim of this book is to explain modern homotopy theory in a manner accessible to graduate students yet structured so that experts can skip over numerous linear developments to quickly reach the topics of their interest Homotopy theory arises from choosing a class of maps called weak equivalences and then passing to the homotopy category by localizing with respect to the weak equivalences i.e. by creating a new category in which the weak equivalences are isomorphisms Quillen defined a model category to be a category together with a class of weak equivalences and additional structure useful for describing the homotopy category in terms of the original category This allows you to make constructions analogous to those used to study the homotopy theory of topological spaces A model category has a class of maps called weak equivalences plus two other classes of maps called cofibrations and fibrations Quillen's axioms ensure that the homotopy category exists and that the cofibrations and fibrations have extension and lifting properties similar to those of cofibration and fibration maps of topological spaces During the past several decades the language of model categories has become standard in many areas of algebraic topology and it is increasingly being used in other fields where homotopy theoretic ideas are becoming important including modern algebraic K theory and algebraic geometry All these subjects and more are discussed in the book beginning with the basic definitions and giving complete arguments in order to make the motivations and proofs accessible to the novice The book is intended for graduate students and research mathematicians working in homotopy theory and related areas

**Model Categories** Mark Hovey, 2007 Model categories are used as a tool for inverting certain maps in a category in a controllable manner They are useful in diverse areas of mathematics This book offers a comprehensive study of the relationship between a model category and its homotopy category It develops the theory of model categories giving a development of the main examples

[A Handbook of Model Categories](#) Scott Balchin, 2021-10-29 This book outlines a vast array of techniques and methods regarding model categories without focussing on the intricacies of the proofs Quillen model categories are a fundamental tool for the understanding of homotopy theory While many introductions to model categories fall back on the same handful of canonical examples the present book highlights a large self contained collection of other examples which appear throughout the literature In particular it collects a highly scattered literature into a single volume The book is aimed at anyone who uses or is interested in using model categories to study homotopy theory It is written in such a way that it can be used as a reference guide for those who are already experts in the field However it can also be used as an introduction to the theory for novices

*Homotopy Limit Functors on Model Categories and Homotopical Categories* William G. Dwyer, 2004 The purpose of this monograph which is aimed at the graduate level and beyond is to obtain a deeper understanding of Quillen's model categories A model category is a category together with three distinguished classes of maps called weak equivalences cofibrations and fibrations Model categories have become a standard tool in algebraic topology and homological algebra and increasingly in other fields where homotopy theoretic ideas are becoming important such as algebraic K theory and algebraic geometry The authors approach is to define the notion of a homotopical category which is more general than that of a model category and to consider model categories as special cases of this A homotopical category is a category with only a single distinguished class of maps called weak equivalences subject to an appropriate axiom This enables one to define homotopical versions of such basic categorical notions as initial and terminal objects colimit and limit functors cocompleteness and completeness adjunctions Kan extensions and universal properties There are two essentially self contained parts and part II logically precedes part I Part II defines and develops the notion of a homotopical category and can be considered as the beginnings of a kind of relative category theory The results of part II are used in part I to obtain a deeper understanding of model categories The authors show in particular that model categories are homotopically cocomplete and complete in a sense stronger than just the requirement of the existence of small homotopy colimit and limit functors A reader of part II is assumed to have only some familiarity with the above mentioned categorical notions Those who read part I and especially its introductory chapter should also know something about model categories
