entertaining examination of the possibility of other life in the universe since Carl Sagan's best work *Boulder Daily Camera*. It's been decades since Carl Sagan first addressed the general public about the possibility of extraterrestrial life from a scientist's perspective. We've learned a lot in those years and now planetary scientist David Grinspoon investigates the big questions: How widespread are life and intelligence in the cosmos? Is life on Earth an accident or in some sense the purpose of this universe? And how can we, working from the Earth-centric definition of life, even begin to think about the varieties of life forms on other planets? In accessible, lively prose and using the topic of extraterrestrial life as a mirror with which to view human beliefs, evolution, history, and aspirations, Grinspoon takes us on a three-part journey: the history of our expanding awareness of other planets and our ideas on alien life dating back to the earliest days of astronomy; the science of cosmic evolution and the evolution of life on Earth, including a critique of the Rare Earth hypothesis and the beliefs that humans hold; addressing the limits of our ability to conceptualize or communicate with intelligent aliens and the scientific and philosophical implications of far future evolutionary possibilities. Rich in personal and often amusing anecdotes, *Lonely Planets* explores the shifting boundary between planetary science and natural philosophy and reveals how the search for extraterrestrial life unites our spiritual and scientific quests for connection with the cosmos. Includes a new foreword about recent Mars discoveries. An outstanding introduction to cosmic evolution. *San Jose Mercury News*. A terrific book. *San Diego Union Tribune*. A personable chat on life, the universe, and everything. *Publishers Weekly*. **The Freemason's Repository**, 1890. **A Short History of Natural Science and of the Progress of Discovery**. Exoplanets, The Frontier of Modern Astronomy. Denzel Carter Jackson. Exoplanets have been found in a relatively small region of our galaxy, the Milky Way. According to NASA's Kepler Space Telescope, there are more planets in the universe than stars. Our solar system's exoplanets comprise similar elements to our planets, but their mixtures may differ. By measuring the sizes, diameters, and masses/weights of exoplanets, we can determine their compositions, which range from very rocky like Earth and Venus to very gaseous like Jupiter and Saturn. Some planets may be dominated by water, ice, or iron, while others are dominated by iron or carbon. A stellar world with lava seas, a puffy planet, and a planet whose core is as dense as Styrofoam have been identified. Since then, we've discovered thousands of exoplanets using various detection methods. From Earth, it is infrequent to see an exoplanet through a telescope the way you might see Saturn. Direct imaging has only been used to find a handful of exoplanets, and these are usually young gas giants orbiting very far from their stars. Exoplanets are now part of our universe. There are thousands of confirmed planets. This is only a tiny part of the entire galaxy. As we increase the number and observing power of robotic telescopes deployed in space, the number could rise into the tens of thousands within a decade.
