d'Amour, Vaiknoras, Kate, Zeller, Manfred, 2017-02-10 An impact assessment IA study was conducted in Season B 2015/2 to

establish the reach of high iron bean HIB varieties to Rwandan bean farmers since these varieties were released in 2010 and

to understand the adoption and diffusion patterns that have occurred so far The IA was carried out in two parts The first part

was a listing survey which was conducted at the beginning of Season B 2015 during the planting period A total of 19 575

households were enlisted in 120 randomly selected villages throughout the country and 93 percent of those households were

bean producing households The listing exercise revealed that 28 percent of bean farmers had grown at least one HIB variety

in at least one season since 2010 the equivalent of approximately half a million households In Season B 2015 20 percent of

bean farmers were reported to be growing an HIB the equivalent of approximately 350 000 households Detailed results of the

listing exercise are available in a separate report³ The second part of the study was a more detailed household survey which

was conducted among a subsample of nearly 1 400 bean farming households immediately after harvest had taken place Both

the listing and main household survey are nationally representative of rural bean producing households in Rwanda This

report presents key descriptive results from the main survey and sheds light on issues that may be investigated further in
