Newton's Optical Writings : A Guided Study Dennis L. Sepper, 1994 *The Cambridge Companion to Newton* Rob Iliffe, George E. Smith, 2016-03-29 Sir Isaac Newton 1642 1727 was one of the greatest scientists of all time a thinker of extraordinary range and creativity who has left enduring legacies in mathematics and physics While most famous for his Principia his work on light and colour and his discovery of the calculus Newton devoted much more time to research in chemistry and alchemy and to studying prophecy church history and ancient chronology This new edition of The Cambridge Companion to Newton provides authoritative introductions to these further dimensions of his endeavours as well as to many aspects of his physics It includes a revised bibliography a new introduction and six new chapters three updating previous chapters on Newton s mathematics his chemistry and alchemy and the reception of his religious views and three entirely new on his religion his ancient chronology and the treatment of continuous and discontinuous forces in his second law of motion

Fictional Matter Helen Thompson, 2017-01-13 Fictional Matter argues that chemical definitions of particulate matter shaped eighteenth century British science and literature In this lucid revisionary analysis of corpuscular science Helen Thompson advances a new account of how the experimental production of empirical knowledge defined the emergent realist novel

The Cambridge History of Science: Volume 3, Early Modern Science David C. Lindberg, Katharine Park, Ronald L. Numbers, Roy Porter, 2003 An account of European knowledge of the natural world c 1500 1700 **The Emergence of a Scientific Culture** Stephen Gaukroger, 2008-10-23 Why did science emerge in the West and how did scientific values come to be regarded as the yardstick for all other forms of knowledge Stephen Gaukroger shows just how bitterly the cognitive and cultural standing of science was contested in its early development Rejecting the traditional picture of secularization he argues that science in the seventeenth century emerged not in opposition to religion but rather was in many respects driven by it Moreover science did not present a unified picture of nature but was an unstable field of different often locally successful but just as often

incompatible programmes To complicate matters much depended on attempts to reshape the persona of the natural philosopher and distinctive new notions of objectivity and impartiality were imported into natural philosophy changing its character radically by redefining the qualities of its practitioners The West's sense of itself its relation to its past and its sense of its future have been profoundly altered since the seventeenth century as cognitive values generally have gradually come to be shaped around scientific ones Science has not merely brought a new set of such values to the task of understanding the world and our place in it but rather has completely transformed the task redefining the goals of enquiry This distinctive feature of the development of a scientific culture in the West marks it out from other scientifically productive cultures In *The Emergence of a Scientific Culture* Stephen Gaukroger offers a detailed and comprehensive account of the formative stages of this development and one which challenges the received wisdom that science was seen to be self-evidently the correct path to knowledge and that the benefits of science were immediately obvious to the disinterested observer
