Moons And Planets

William K. Hartmann

Moons And Planets:

Earth, Moon, and Planets Fred Lawrence Whipple, 1968 The increase in our knowledge of the solar system during the five years since the author last revised this book 1963 greatly exceeds that in the previous two decades The program of the U S National Aeronautics and Space Administration and the space program of the U S S R have been prime contributors to this rapid progress but the impetus has carried over to groundbased studies of the Moon and planets as well The advances in radio and radar astronomy alone are striking and are continuing at an accelerating pace This third edition of Mr Whipple s popular and authoritative book is thoroughly revised in light of this new knowledge The most extensive revisions are in the chapters on the Moon Mars and Venus the members of the solar system on which the various space programs have concentrated The author has included many new and dramatic illustrations in this third edition among them photographs taken from U S and Russian space craft There are striking photographs of the Moon with close up views of its surface texture pictures of Mars taken from Mariner IV and radar pictures of Venus that see through that planet s obscuring cloud layer The book is written in nontechnical language and with a lucid witty style that is readily understandable to the interested layman Mathematics has been avoided and scientific methods and processes are described in simple terms In presenting the latest information about the planets and their moons Mr Whipple discusses their origin and evolution motions atmospheres temperatures surface conditions the environment essential for life as we know it and the possibilities of life outside the Earth He concludes with a discussion of current theories about the origin of the solar system

origins of life makes the solar system an even weirder and more wonderful place than it seemed before Wall Street Journal In

1959 the Soviet probe Luna 3 revealed an astonishing truth the far side of the moon is an enormous mountainous expanse completely different from the vast lava plains on the side facing Earth But why would the two side of the moon be so different And what might this tell us about our own place in the universe As it turns out quite a lot Fourteen billion years ago the universe exploded into being creating galaxies and stars Planets formed out of the leftover dust and gas that coalesced into larger and larger bodies orbiting around each star In a sort of heavenly survival of the fittest planetary bodies smashed into each other until solar systems emerged Curiously instead of being relatively similar in terms of composition the planets in our solar system and the comets asteroids satellites and rings are bewitchingly distinct So too the halves of our moon In When the Earth Had Two Moons esteemed planetary geologist Erik Asphaug takes us on an exhilarating tour through the farthest reaches of time and our galaxy Beautifully written and provocatively argued When the Earth Had Two Moons is not only a revealing look at outer space but a profound inquiry into the nature of life here

Earth, Moon and Planets Fred Lawrence Whipple, 1968 **Moons: A Very Short Introduction** David A. Rothery, 2015-11-26

Proving to be both varied and fascinating moons are far more common than planets in our Solar System Our own Moon has had a profound influence on Earth not only through tidal effects but even on the behaviour of some marine animals Many remarkable things have been discovered about the moons of the giant outer planets from Voyager Galileo Cassini and other spacecraft Scientists have glimpsed volcanic activity on Io found oceans of water on Titan and captured photos of icy geysers bursting from Enceladus It looks likely that microbial life beyond the Earth may be discovered on a moon rather than a planet In this Very Short Introduction David Rothery introduces the reader to the moons of our Solar System beginning with the early discoveries of Galileo and others describing their variety of mostly mythological names and the early use of Jupiter's moons to establish position at sea and to estimate the speed of light Rothery discusses the structure formation and influence of our Moon and those of the other planets and ends with the recent discovery of moons orbiting asteroids whilst looking forward to the possibility of finding moons of exoplanets in planetary systems far beyond our own **ABOUT THE SERIES** The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area These pocket sized books are the perfect way to get ahead in a new subject quickly Our expert authors combine facts analysis perspective new ideas and enthusiasm to make interesting and challenging topics highly readable
