Neural Prostheses Hc 2000:

Closed-Loop Systems for Next-Generation Neuroprostheses Timothée Levi, Paolo Bonifazi, Paolo Massobrio, Michela Chiappalone, 2018-04-26 Millions of people worldwide are affected by neurological disorders which disrupt the connections within the brain and between brain and body causing impairments of primary functions and paralysis Such a number is likely to increase in the next years and current assistive technology is yet limited A possible response to such disabilities offered by the neuroscience community is given by Brain Machine Interfaces BMIs and neuroprostheses The latter field of research is highly multidisciplinary since it involves very different and disperse scientific communities making it fundamental to create connections and to join research efforts Indeed the design and development of neuroprosthetic devices span involve different research topics such as interfacing of neural systems at different levels of architectural complexity from in vitro neuronal ensembles to human brain bio artificial interfaces for stimulation e g micro stimulation DBS Deep Brain Stimulation and recording e g EMG Electromyography EEG Electroencephalography LFP Local Field Potential innovative signal processing tools for coding and decoding of neural activity biomimetic artificial Spiking Neural Networks SNN and neural network modeling In order to develop functional communication with the nervous system and to create a new generation of neuroprostheses the study of closed loop systems is mandatory It has been widely recognized that closed loop neuroprosthetic systems achieve more favorable outcomes for users then equivalent open loop devices Improvements in task performance usability and embodiment have all been reported in systems utilizing some form of feedback The bi directional communication between living neurons and artificial devices is the main final goal of those studies However closed loop systems are still uncommon in the literature mostly due to requirement of multidisciplinary effort Therefore through eBook on closed loop systems for next generation neuroprostheses we encourage an active discussion among neurobiologists electrophysiologists bioengineers computational neuroscientists and neuromorphic engineers This eBook aims to facilitate this process by ordering the 25 contributions of this research in which we highlighted in three different parts A Optimization of different blocks composing the closed loop system B Systems for neuromodulation based on DBS EMG and SNN and C Closed loop BMIs for rehabilitation

Operative Neuromodulation Damianos E. Sakas, Brian A. Simpson, 2007-12-03 Neuromodulation is a rapidly evolving multidisciplinary biomedical and biotechnological field The two volumes present the state of the art in established and emerging applications for pain spasticity movement disorders bladder and bowel dysfunction cardiovascular disease epilepsy psychiatric illness impairment of hearing and vision and computational neuromodulation Experts describe the neural networks involved and the appropriate surgical approaches provide clinical guidelines technical descriptions of implanted devices proposals for refinements and personal views on future prospects of the field The immense therapeutic potential is highlighted which arises from the close collaboration of biomedical scientists and biotechnological engineers in this area and signifies the transition from the conventional resective surgery to functional

neuroprosthetic surgery Vol I and neural networks surgery Vol II which uses neuro engineering to improve impaired neural function Vol 2 describes the techniques and procedures applied by direct a contact with the central nervous system or cranial nerves in order to modulate the function of neural networks as in the case of motor cortex stimulation for pain or vagus nerve stimulation for epilepsy or b in deeply located structures inside the nervous system in order to alter the function on specific networks as in the case of deep brain stimulation for Parkinson s disease

Smart Sensors for Health and Environment Monitoring Chong-Min Kyung,2015-07-22 This book covers two most important applications of smart sensors namely bio health sensing and environmental monitoring The approach taken is holistic and covers the complete scope of the subject matter from the principles of the sensing mechanism through device physics circuit and system implementation techniques and energy issues to wireless connectivity solutions It is written at a level suitable mainly for post graduate level researchers interested in practical applications The chapters are independent but complementary to each other and the book works within the wider perspective of essential smart sensors for the Internet of Things IoT This is the second of three books based on the Integrated Smart Sensors research project which describe the development of innovative devices circuits and system level enabling technologies The aim of the project was to develop common platforms on which various devices and sensors can be loaded and to create systems offering significant improvements in information processing speed energy usage and size This book contains substantial reference lists and over 150 figures introducing the reader to the subject in a tutorial style whilst also addressing state of the art research results allowing it to be used as a guide for starting researchers

Anticipation and the control of voluntary action Dorit Wenke,Rico Fischer, A major hallmark in the adaptive control of voluntary action is the ability to anticipate short and long term future events Anticipation in its various forms is an important prerequisite for higher order cognitive abilities such as planning reasoning and the pursuit of both immediate goals and long term goals that may even stand in opposition to immediate desires and needs e g to invest in pension funds Therefore it is not surprising that diverse and rather independent research lines have evolved all somehow targeting various anticipatory capacities that are involved in the control of voluntary action and thus contribute to the uniqueness of human goal directed behavior For example prediction of the incentive value of action outcomes drives goal directed instrumental behavior e g Dickinson Rushworth Prinz 1990 Furthermore the degree of match between intended anticipated and actual action effects has been proposed to be a major determinant of motor programming and online action corrections Jeannerod 1981 motor learning e g Wolpert Diedrichsen e g Abell Happ Los Nobre Coull 2010 and to anticipate conflict e g Correa Rao Nobre 2009

Voluntary action is influenced by the anticipation and prediction of mental effort in task processing e.g. Song Schwarz 2008 In addition the anticipation of long term future social consequences e.g. expected aloneness has been shown to affect cognitive mechanisms involved in logic and reasoning e.g. Baumeister Twenge Nuss 2002 Last but not least learning of statistical contingencies e.g. conflict frequency leads to the anticipation and prediction of context specific executive control requirements e.g. Crump Gong Milliken 2006 Dreisbach Haider 2006 The aim of the present Research Topic is to provide a platform that offers the possibility of cross fertilization and enhanced visibility among to date rather segregated research lines
