**Studying the Role of Nuclear Structure Effects in Neutron-induced Reactions Using GEANIE at LANSCE.** , 2000 Efforts to model and measure absolute neutron induced reaction cross sections have for the

most part been limited by experimental techniques to neutron energies found in reactors and light ion fusion reactions i e t d n alpha etc This can in large part be attributed to the difficulty involved in making high flux mono energetic neutron beams with  $E_{\text{n}}$  14 MeV The result has been a lack of guidance for  $n \rightarrow n + p + \gamma$  alpha reaction modeling for  $E_{\text{n}}$  1 2 MeV These limitations become particularly exacerbated in nuclei where structure effects i e near shell closures high deformation etc or fission complicates the models The GEANIE spectrometer at LANSCE WNR fills this gap in experimental technique by allowing for efficient measurement of neutron induced gamma ray partial cross sections over a wide range of incident neutron energies 1
