Neutrons in Biology Benno P. Schoenborn, 2013-12-01 **Neutrons in Biology** Benno P. Schoenborn, Robert B. Knott, 2012-12-06 This compendium presents some of the major applications of neutron scattering techniques to problems in biology. It is a record of the papers presented at the Neutrons in Biology Conference, the third in an occasional series held to highlight progress in the field and to provide a focus for future direction. The strength of the neutron scattering technique remains principally in the manipulation of scattering density through hydrogen and deuterium atoms. The development of advanced detectors, innovative instrument and beamline components and sophisticated data acquisition systems through the 1970s and early 1980s provided a sound foundation for the technique. With continued development, some of the exotic and expensive equipment has become affordable by the medium-sized facilities, thereby broadening the user base considerably. Despite problems with the major neutron sources in the late 1980s and early 1990s, some spectacular results have been achieved. Whilst the high and medium flux beam reactors will continue to make a major impact in the field, the results from the first experiments and the planned developments on spallation neutron sources clearly indicate that the technique has enormous potential.
