### **Brain Networks in Aging: Reorganization and Modulation by Interventions**

Junfeng Sun, Chunbo Li, 2018-02-22 Old adults undertake multiple reduced cognitive abilities in aging which are accompanied with specific brain reorganization in forms of regional brain activity and brain tissues inter region connectivity and topology of whole brain networks in both function and structure The plasticity changes of brain activities in old adults are explained by the mechanisms of compensation and dedifferentiation For example older adults have been observed to have greater usually bilateral prefrontal activities during memory tasks compared to the typical unilateral prefrontal activities in younger adults which was explained as a compensation for the reduced brain activities in visual processing cortices Dedifferentiation is another mechanism to explain that old adults are with much less selective and less distinct activity in task relevant brain regions compared with younger adults A larger number of studies have examined the plasticity changes of brain from the perspective of regional brain activities However studies on only regional brain activities cannot fully elucidate the neural mechanisms of reduced cognitive abilities in aging as multiple regions are integrated together to achieve advanced cognitive function in human brain In recent years brain connectivity network which targets how brain regions are integrated have drawn increasing attention in neuroscience with the development of neuroimaging techniques and graph theoretical analysis Connectivity quantifies functional association or neural fibers between two regions that may be spatially far separated and graph theoretical analysis of brain network examines the complex interactions among multiple regions from the perspective of topology Studies showed that compared to younger adults older adults had altered strength of task relevant functional connectivity between specific brain regions in cognitive tasks and the alteration of connectivity are correlated to behavior performance For example older adults had weaker functional connectivity between the premotor cortex and a region in the left dorsolateral prefrontal cortex in a working memory task Interventions like cognitive training and neuro modulation e g transcranial magnetic stimulation have been shown to be promising in regaining or retaining the decreasing cognitive abilities in aging However only few neuroimaging studies have examined the influence of interventions to old adult s brain activity connectivity and cognitive performance This Research Topic calls for contributions on brain network of subjects in normal aging or with age related diseases like mild

cognitive impairment and Alzheimer's disease. The studies are expected to be based on neuroimaging techniques including but not limited to functional magnetic resonance imaging, Electroencephalography and diffusion tensor imaging and contributions on the influence of interventions to brain networks in aging are highly encouraged. All these studies would enrich our understanding of neural mechanisms underlying aging and offer new insights for developing possible interventions to retain cognitive abilities in aging subjects.

## **Ear-Centered Sensing: From Sensing Principles to Research and Clinical Devices, Volume II**

Martin Georg Bleichner, Preben Kidmose, Jérémie Voix, 2023-11-28

This Research Topic is part of the Ear Centered Sensing From Sensing Principles to Research and Clinical Devices series. From Sensing Principles to Research and Clinical Devices Volume I: The human ears are an attractive location for bio signal acquisition. Heart rate, respiratory rate, eye blink and eye motion signals and skin conductance as well as the electrical activity from muscles and the brain can be recorded from the ear. Moreover, the ears provide a discreet and natural anchoring point for placing the necessary wearable hardware, thereby reducing the visibility of integrated devices. We define ear centered sensing as monitoring physiological signals with sensors located in the ear canal, in the pinna or around the ear. Ear centered sensing allows data recording over extended periods of time in everyday situations with little disturbance for the users. The combination of physical measurements such as motion, temperature and moisture and electrophysiological measurements such as electroencephalography (EEG), electrocardiography (ECG), electromyography (EMG), electrooculography (EOG) and electrodermal activity (EDA) for example, integrated over long time periods will help to gain a better understanding of psycho-physiological processes. Ear centered sensing is therefore of interest for scientific, diagnostic and therapeutic purposes and we believe that it will play a significant role in future mobile health applications. As the ear is an unconventional place for monitoring these physiological measures, a common challenge for ear centered sensing is to gain a better understanding of the signals that are recorded at this location. The questions that need to be answered are: How does the signal (e.g. ECG or EEG) acquired at the ear relate to the signal as acquired at the classical recording sites? Which signals are ear centered systems sensitive to? Which signals are lost? How can we reliably discriminate in real time signals from artifacts? And finally, how do we interpret data that is acquired over extended periods of time when we have little or no control over the recording environment? For the sensing of physiological signals over extended periods of time, dedicated sensor and amplifier technology is needed that is convenient to use, robust and reliable. People wearing these sensors should not be restricted in their activities. Hence, for long term usage, sensor and amplifier technology need to be unobtrusive in every aspect: the materials need to be biocompatible, adjust to the individual's anatomy and be comfortable to wear. They need to be sufficiently robust to allow for continued usage and self fitting and they need to be small and inconspicuous. The electronic instrumentation including bio signal conditioners and amplifiers, analog to digital converters, means for signal processing and wireless transmission need to be sufficiently small and light weight to be placed at the ear together with the sensors. The

power supply has to be secured either by low power electronics or by smart ways to recharge the battery or even by harvesting body energy For the tiny signal changes as produced for example by brain activity amplifiers need to be sensitive enough to detect them while maintaining robust artifact rejection capabilities **Through a Glass, Darkly: The Influence of the EEG Reference on Inference About Brain Function and Disorders** Pedro Antonio Valdes-Sosa,Paul L.
