*Ubiquitous Computing* Michael David Pinkerton,1997      **Technologies in Mobile Terminals Enabling Ubiquitous Services** Petteri Alahuhta,Valtion teknillinen tutkimuskeskus,2011 The vision of ubiquitous computing dates back to the early 1990s Ubiquitous computing is a model of human computer interaction in which information processing is seamlessly integrated into everyday objects and environments During the 2000s the ubiquitous computing vision has extended and blended with wireless mobile communications to become ubiquitous computing and communication If earlier information processing was done mainly in static office environments new advances in mobile technologies offer access to the information and services that are relevant to us in this very situation and right now In this research an attempt is made to better understand the development of the digital mobile phone as a platform for ubiquitous services Ubiquitous services are mobile services that are capable of using contextual information and ICT based resources in proximity to the user of the mobile phone The hypothesis of the research is that there is a technology trajectory that makes the mobile phone a host providing gateway and hub functionality to the ubiquitous services We introduce a theoretical framework for analyzing the evolution of mobile devices The framework is based on several theories of innovation It addresses aspects of the introduction new technology dominant designs technology diffusion and users needs According to the analysis of empirical material using our theoretical framework the mobile phone has the potential to become a gateway to ubiquitous services largely due to the new technologies integrated with it New functionalities and technologies such as local connectivity and sensor technology in mobile phones play a key role in helping developers implement ubiquitous services utilizing contextual information Potential challenges for the diffusion of ubiquitous services are privacy and to some extend environmental issues      **Mobile, Ubiquitous, and Pervasive Learning** Alejandro Peña Ayala,2015-12-12 This book is concerned with the mobile ubiquitous and pervasive learning arena It present a collection of works corresponding to four categories reviews studies conceptual proposals and approaches As a result of the submission and revision processes eight manuscripts were accepted and organized into the aforementioned four parts as follows Review a couple of chapters offer a survey of related works One concerns with the diversity of mobile ubiquitous and pervasive labor where interested findings are unveiled based on correlations Other focuses on adaptive and adaptable architectures that are suitable to implement ubiquitous learning sceneries whose contribution represents a model of a domain specific architecture Studies two chapters explore issues related to the effect of question styles made through smartphones and tablets and the disposition of teachers to exploit mobile devices at classroom Conceptual a pair of chapters offer a given proposal the first to develop adaptive mobile learning systems by means of a framework based on contextual information and the second with the purpose to share some guidelines of how to apply cloud computing in the development and operation of mobile Approaches two chapters apply a specific paradigm as part of a whole application and reveal the achieved impact One of them uses augmented reality to encourage

children to learn about trees as context sensitive informal learning The other immerses children in playing a learning game to learn math by cooperating between members team and interacting through mobile devices This volume will be a source of interest for researchers practitioners professors and postgraduate students aimed at updating their knowledge and finding targets for future work in the mobile ubiquitous and pervasive learning field *Ubiquitous Positioning and Mobile Location-Based Services in Smart Phones* Chen, Ruizhi,2012-06-30 Many smart phone users reap the benefits of location based services While tracking users positions using their smart phone is an issue of concern for some others who use Foursquare or rely on their Android GPS view location based services as a necessity Ubiquitous Positioning and Mobile Location Based Services in Smart Phones explores new research in smart phones with an emphasis on positioning solutions in smart phones smart phone based navigation applications mobile geographical information systems and related standards

*Mobile and Ubiquitous Learning* Shengquan Yu,Mohamed Ally,Avgoustos Tsinakos,2017-11-16 This book explores the latest trends and technologies in the field of mobile and ubiquitous learning It highlights best practices in technology enhanced learning and explores how new technologies such as mobile augmented and wearable technologies are shaping instructional design strategies and the content curriculum development process The book consists of approximately 20 chapters written by international experts in the field of mobile and ubiquitous learning The authors hail from Austria Brazil Canada China Greece India Malaysia Mauritius Saudi Arabia Spain Sweden and the United Kingdom Topics covered include but are not limited to Use of social media in mobile learning Contexts of learning and challenges of mobility Designing for formal informal and non formal learning Mobile virtual reality a promising technology to change the way we learn and teach Mobile applications for encyclopedias Ethical considerations in the incorporation of mobile and ubiquitous technologies into teaching and learning Use of augmented reality in mobile learning for students with disabilities Using wearable technology to support transfer of expertise and Core technologies in mobile learning Providing valuable insights on the future of education and the upcoming pedagogies that will be applied in traditional distance and blended learning the book offers educators and stakeholders essential guidance in making innovations for the new generations of learners in the 21st century *Addressing the Needs of Mobile Users* Timothy Youngjin Sohn,2008 Mobile phones hold the promise of enabling the ubiquitous computing vision bringing computing power into our daily lives Using sensors and actuators built into the devices we carry applications can provide us with context aware information delivery Ubiquitous computing systems can use sensing capabilities and information access to help people accomplish their tasks and take advantage of unseen opportunities The high mobile phone penetration rate across the world makes this platform ideal for building many of these advanced applications In order to enable more advanced mobile applications we face several technological and human challenges Although mobile phones today are similar to computers from a decade ago they are still limited in their computation network storage and input capabilities These areas are rapidly improving to enable further innovation in mobile computing More

important than the technical challenges are the human challenges Unlike desktop or nomadic computing being mobile means there is an fundamental problem of limited attention that must be dealt with Mobile users are often engaged in several tasks at once trying to stay active in their main task and interact with their mobile device at the same time A lack of attentional resources naturally limits the amount of interaction one can have with his mobile device hence the need for technology and applications that are designed with the users attentional resources in mind Addressing this fundamental human problem alongside the other technical challenges open the way for advancing the ubiquitous computing vision This dissertation provides a structure to the rapidly expanding mobile space by contributing work that focuses on addressing the fundamental problem that mobile users face limited attention span The contributions of this dissertation are three fold 1 an understanding of the fundamental problem that mobile users face which is often being engaged in another task while trying to gather information 2 demonstration of using low fidelity mobile phone sensors for context awareness that can be used to alleviate the problems mobile users face and 3 a description of the unique character of ubiquitous computing applications and the promise for changing the way we live in our mobile world These core contributions demonstrate the problems that mobile users face as well as several technological and design solutions to lessen the burden that they feel Future mobile advancements will need to account for the lack of attentional resources in order to build systems that help improve people's lives by enhancing the ubiquitous computing vision

Muhammad Omer Rashid,2010 Location plays an important role in current mobile applications and services whether it is social applications gaming entertainment or mobile commerce the global market for LBS is projected to reach 13 26 billion by 2015 and a subscriber base of 1 24 billion It is the well proven winning combination of location awareness and ubiquitous nature of mobile phones that is responsible for a steady increase in mobile data usage and it is predicted that by 2013 mobile devices will overtake PC as the most common web access device Applications and services utilising traditional location tracking approaches of GPS and Cell id fail to provide a good experience indoors so alternative location positioning schemes need to be utilised These applications claim to be truly ubiquitous however whether they are social applications commerce advertising gaming or entertainment applications they still tend to engulf the user in computing process for example if we consider location based or mobile mixed reality gaming it becomes clear that although location plays a part in the game play actual user interaction with the localised environment is often limited The work presented in this thesis explores the utilisation of implied location technologies to bridge the gap left by the current applications In particular it investigates the use of Bluetooth and NFC in to locate the mobile user The approach taken by this research is to look at utilisation of implied location technologies across a range of applications and services through real world experimentation In particular their effectiveness has been researched in relation to three areas considered likely to benefit most from location based information mobile advertising mixed reality gaming and mobile social applications Work carried out on providing location based advertising for existing mobile users via Bluetooth has shown that implied location technologies can be very useful to improve the diminishing response to mobile advertising Mixed reality game Pac Lan demonstrates that NFC can not only be utilised as an implied location positioning scheme but also for improving user interaction with the real world It has also

shown that effective user interaction with physical objects can be achieved through NFC resulting in an enhanced user experience. Results presented within have also shown that implied location positioning schemes are effective in mixed reality gaming context and can lead to interesting tactics developing over subsequent game play. From a mobile social application perspective the work presented here shows that through use of NFC social inclusion can be achieved at both individual and group level. Moreover utilising NFC for mobile social applications can help achieve a symbiosis between user device and environment where interaction space is not simply the space where interaction amongst users takes place but is an integral part of the experience. Mobile Access to Government Information and Services Jordan L. Weaver, 2015-06-20 Today millions of Americans use mobile devices like smartphones and tablet computers on a daily basis to communicate and obtain information. Further due to recent technical advances in mobile technology consumers can use these devices to carry out a broad range of activities that previously required a desktop or laptop computer including shopping, banking and accessing government services. Given these trends providing government information and services anytime anywhere and on any device has become increasingly important particularly as some mobile users may not have any other means of online access. This book describes the demographics of mobile users and the factors that might be associated with the increased use of mobile devices, the devices individuals are using to access government services and the challenges people face and the actions the federal government has taken to enhance access to government services via mobile devices. This book also examines a report on Congress Member adoption and use of two social networking services Twitter and Facebook. The book analyzes data on Member use of Twitter and Facebook collected by an academic institution in collaboration with the Congressional Research Service during a two month period between August and October 2011 and the adoption of both platforms as of January 2012.

**Mobility, Data Mining and Privacy** Fosca Giannotti, Dino Pedreschi, 2010-10-19. Mobile communications and ubiquitous computing generate large volumes of data. Mining this data can produce useful knowledge yet individual privacy is at risk. This book investigates the various scientific and technological issues of mobility, data open problems and roadmap. The editors manage a research project called GeoPKDD Geographic Privacy Aware Knowledge Discovery and Delivery and this book relates their findings in 13 chapters covering all related subjects. **Project Octopus** Marcus Alzona, 1994. Abstract Laptop computers and personal data assistants PDAs offer users the promise of mobile computing. Providing these mobile devices with wide area network connectivity is one of the challenges faced by mobile computing application developers. Specialized wireless applications such as fleet tracking and remote monitoring devices.

have already revolutionized the way some companies do business Soon other companies will realize the competitive advantage gained by placing information at the fingertips of a mobile workforce In general present day network applications have been designed for wire based networks These networks and their associated applications have evolved through the years Highly reliable communication rates in the millions of bits per second are now commonplace Wireless communication marks a notable change in this trend towards faster more reliable networks However high error rates frequent disconnection limited coverage and data communication rates in the thousands of bits per second are common in wireless communication Available wireless technologies offer tradeoffs between these characteristics This makes optimizing wireless applications difficult To free the application developer from these concerns we have designed a wireless communications framework Our Framework will not only free the developer from network communication specifics but will also dynamically choose the optimal technology for data transmissions This will allow applications to use a variety of networks while optimizing cost mobility and performance
