Mobile Fading Channels:

Mobile Fading Channels Matthias Pätzold, 2002-04 Mobile channel fading is a loss in transmission intensity caused by changes in the transmission medium. By dealing with the modelling analysis and simulation of mobile fading channels, this text provides a fundamental understanding of many issues in the area of mobile fading channel modelling. The main topics addressed in the volume are fundamentals of stochastic and deterministic channel models and modelling and simulation of frequency nonselective and frequency selective fading channels. The guide also features methods for the design and realization of efficient channel simulators and fast channel simulators and MATLAB programs for the evaluation and simulation of mobile fading channels.

Framework of Three-dimensional Double-ring Mobile-to-mobile Fading Channels 曹建, 2007

Mobile Radio Channels Matthias Pätzold, 2011-10-13 Providing a comprehensive overview of the modelling analysis and simulation of mobile radio channels, this book gives a detailed understanding of fundamental issues and examines state-of-the-art techniques in mobile radio channel modelling. It analyses several mobile fading channels including terrestrial and satellite flat fading channels, various types of wideband channels and advanced MIMO channels, providing a fundamental understanding of the issues currently being investigated in the field. Important classes of narrowband, wideband and space-time wireless channels are explored in detail with descriptions of efficient simulation methods for mobile radio channels being central. Strong emphasis is placed on the detailed origin of the presented channel models and a high degree of mathematical unity is conveyed. Using the described channel models, the reader can evaluate the performance of wireless communication systems under propagation conditions which are typical for multipath channels in various environments. Introduces the fundamentals of stochastic and deterministic channel models. Explores the modelling and simulation of both wideband and narrowband mobile radio channels as well as several classes of MIMO channels. Describes general concepts including geometrical reference and simulation models. Discusses several methods for the modelling of given Doppler delay and angular profiles. Elaborates on methods for the design analysis and realisation of efficient channel simulators. Examines techniques for the development of fast channel simulators. Provides links for downloading MATLAB programs enabling the simulation and analysis of the mobile fading channels models presented on the companion website <http://www.wiley.com/go/paetzold>.

Propagation Channel Characterization, Parameter Estimation, and Modeling for Wireless Communications Xuefeng Yin, Xiang Cheng, 2016-09-13 A comprehensive reference giving a thorough explanation of propagation mechanisms, channel characteristics, results, measurement approaches and the modelling of channels. Thoroughly covering channel characteristics and parameters, this book provides the knowledge needed to design various wireless systems such as cellular communication systems, RFID and ad hoc wireless communication systems. It gives a detailed introduction to aspects of channels before presenting the novel

estimation and modelling techniques which can be used to achieve accurate models To systematically guide readers through the topic the book is organised in three distinct parts The first part covers the fundamentals of the characterization of propagation channels including the conventional single input single output SISO propagation channel characterization as well as its extension to multiple input multiple output MIMO cases Part two focuses on channel measurements and channel data post processing Wideband channel measurements are introduced including the equipment technology and advantages and disadvantages of different data acquisition schemes The channel parameter estimation methods are then presented which include conventional spectral based estimation the specular path model based high resolution method and the newly derived power spectrum estimation methods Measurement results are used to compare the performance of the different estimation methods The third part gives a complete introduction to different modelling approaches Among them both scattering theoretical channel modelling and measurement based channel modelling approaches are detailed This part also approaches how to utilize these two modelling approaches to investigate wireless channels for conventional cellular systems and some new emerging communication systems This three part approach means the book caters for the requirements of the audiences at different levels including readers needing introductory knowledge engineers who are looking for more advanced understanding and expert researchers in wireless system design as a reference Presents technical explanations illustrated with examples of the theory in practice Discusses results applied to 4G communication systems and other emerging communication systems such as relay CoMP and vehicle to vehicle rapid time variant channels Can be used as comprehensive tutorial for students or a complete reference for engineers in industry Includes selected illustrations in color Program downloads available for readers Companion website with program downloads for readers and presentation slides and solution manual for instructors Essential reading for Graduate students and researchers interested in the characteristics of propagation channel or who work in areas related to physical layer architectures air interfaces navigation and wireless sensing
