Soft Real-Time Systems: Predictability vs. Efficiency Giorgio C Buttazzo, Giuseppe Lipari, Luca Abeni, Marco Caccamo,2006-07-02 Hard real time systems are very predictable but not sufficiently flexible to adapt to dynamic situations They are built under pessimistic assumptions to cope with worst case scenarios so they often waste resources Soft real time systems are built to reduce resource consumption tolerate overloads and adapt to system changes They are also more suited to novel applications of real time technology such as multimedia systems monitoring apparatuses telecommunication networks mobile robotics virtual reality and interactive computer games This unique monograph provides concrete methods for building flexible predictable soft real time systems in order to optimize resources and reduce costs It is an invaluable reference for developers as well as researchers and students in Computer Science

Dynamic Reconfiguration Ramachandran Vaidyanathan, Jerry Trahan,2007-06-30 Dynamic Reconfiguration Architectures and Algorithms offers a comprehensive treatment of dynamically reconfigurable computer

architectures and algorithms for them. The coverage is broad starting from fundamental algorithmic techniques ranging across algorithms for a wide array of problems and applications to simulations between models. The presentation employs a single reconfigurable model, the reconfigurable mesh, for most algorithms to enable the reader to distill key ideas without the cumbersome details of a myriad of models. In addition to algorithms the book discusses topics that provide a better understanding of dynamic reconfiguration such as scalability and computational power and more recent advances such as optical models, run time reconfiguration on FPGA and related platforms and implementing dynamic reconfiguration. The book, featuring many examples and a large set of exercises, is an excellent textbook or reference for a graduate course. It is also a useful reference to researchers and system developers in the area.

Nearest Neighbor Search: Apostolos N. Papadopoulos, Yannis Manolopoulos, 2006-11-22. Modern applications are both data and computationally intensive and require the storage and manipulation of voluminous traditional alphanumeric and nontraditional data sets images, text, geometric objects, time series. Examples of such emerging application domains are Geographical Information Systems (GIS), Multimedia Information Systems, CAD/CAM, Time Series Analysis, Medical Information Systems, On Line Analytical Processing (OLAP) and Data Mining. These applications pose diverse requirements with respect to the information and the operations that need to be supported. From the database perspective new techniques and tools therefore need to be developed towards increased processing efficiency. This monograph explores the way spatial database management systems aim at supporting queries that involve the space characteristics of the underlying data and discusses query processing techniques for nearest neighbor queries. It provides both basic concepts and state of the art results in spatial databases and parallel processing research and studies numerous applications of nearest neighbor queries.

Written for both scholars and practitioners, Pervasive Information Systems is organized into three sections, each investigating a distinct part of the subject. Part I focuses on the design challenges of Pervasive Information Systems (PS) and discusses issues relating to the coordination of PS through middleware structures as well as issues related to the efficient deployment of PS. Part II discusses the challenges and limitations of deploying pervasive technologies to support domestic, corporate and public systems. Part III presents two emerging research fields of PS design for aesthetics and PS evaluation.
