**Modal Logic and Process Algebra** Alban Ponse,2000    **Modal Logic and Process Algebra** Alban Ponse,1995-01 A collection of papers by leading researchers in modal logic and theoretical computer science    **Modal Logic** Patrick Blackburn,Maarten de Rijke,Yde Venema,2002-08-22 This is an advanced 2001 textbook on modal logic a field which caught the attention of computer scientists in the late 1970s Researchers in areas ranging from economics to computational linguistics have since realised its worth The book is for novices and for more experienced readers with two distinct tracks clearly signposted at the start of each chapter The development is mathematical prior acquaintance with first order logic and its semantics is assumed and familiarity with the basic mathematical notions of set theory is required The authors focus on the use of modal languages as tools to analyze the properties of relational structures including their algorithmic and algebraic aspects and applications to issues in logic and computer science such as completeness computability and complexity are considered Three appendices supply basic background information and numerous exercises are provided Ideal for anyone wanting to learn modern modal logic    *Introduction to Mathematical Logic* Elliott Mendelson,2009-08-11 Retaining all the key features of the previous editions *Introduction to Mathematical Logic* Fifth Edition explores the principal topics of mathematical logic It covers propositional logic first order logic first order number theory axiomatic set theory and the theory of computability The text also discusses the major results of Godel Church    *Hajnal Andréka and István Németi on Unity of Science* Judit Madarász,Gergely Székely,2021-05-31 This book features more than 20 papers that celebrate the work of Hajnal Andréka and István Németi It illustrates an interaction between developing and applying mathematical logic The papers offer new results as well as surveys in areas influenced by these two outstanding researchers They also provide details on the after life of some of their initiatives Computer science connects the papers in the first part of the book The second part concentrates on algebraic logic It features a range of papers that hint at the intricate many way connections between logic algebra and geometry The third part explores novel applications of logic in relativity theory philosophy of logic philosophy of physics and spacetime and methodology of science They include such exciting subjects as time travelling in emergent spacetime The short autobiographies of Hajnal Andréka and István Németi at the end of the book describe an adventurous journey from electric engineering and Maxwell's equations to a complex system of computer programs for designing Hungary's electric power system to exploring and contributing deep results to Tarskian algebraic logic as the deepest core theory of such questions then on to applications of the results in such exciting new areas as relativity theory in order to rejuvenate logic itself    Information Systems-correctness And Reusability - Selected Papers Form The Is-core Workshop Roel J Wieringa,R B Feenstra,1995-06-09 This volume contains papers on formal system specification The chapters treat algebraic specification temporal logic specification default specifications and deontic logic specification Applications include information systems distributed systems and real time systems One of the major themes in the book is the motivation

to bring formal specification techniques one step further towards realistic applications

Mathematical Frameworks for Component Software Zhiming Liu, Jifeng He, 2006 The range of components technology is both wide and diverse but some common understanding is emerging through the ideas of model based development. These include the notions of interfaces contracts services connectors and architectures. Key issues in the application of the technology are becoming clearer including the consistent integration of different views of a component component composition component coordination and transformation for platforms. However we still know little about theories that support analysis and synthesis of component based systems. The distinct feature of this volume is its focus on mathematical models that identify the core concepts as first class modeling elements and its providing of techniques for integrating and relating them. The volume contains eleven chapters by well established researchers writing from different perspectives. Each chapter gives explicit definitions of components in terms of a set of key aspects and addresses some of the problems of integration and analysis of various views component specification component composition component coordination refinement and substitution and techniques for solving problems. The concepts and techniques are motivated and explained with the help of examples and case studies.

*Logic* Wilfrid Hodges, 1996 This book contains twenty one essays by leading authorities on aspects of contemporary logic ranging from foundations of set theory to applications of logic in computing and in the theory of fields. In those parts of logic closest to computer science the gap between foundations and applications is often small as illustrated by three essays on the proof theory of non classical logics. There are also chapters on the lambda calculus on relating logic programs to inductive definitions on Buechi and Presburger arithmetics and on definability in Lindenbaum algebras. Aspects of constructive mathematics discussed are embeddings of Heyting algebras and proofs in mathematical analysis. Set theory is well covered with six chapters discussing Cohen forcing Baire category determinacy Nash Williams theory critical points and the remarkable connection between them and properties of left distributive operations and independent structures. The longest chapter in the book is a survey of 0 minimal structures by Lou van den Dries during the last ten years these structures have come to take a central place in applications of model theory to fields and function theory and this chapter is the first broad

survey of the area Other chapters illustrate how to apply model theory to field theory complex geometry and groups and how to recover from its automorphism group Finally one chapter applies to the theory of toric varieties to solve problems about many valued logics    **The Cumulative Book Index** ,1996 A world list of books in the English language    Report CS-R
