Networks Asimakis E. Tzamaloukas,2000 This thesis focuses on the medium access control MAC layer Many MAC protocols for wireless networks proposed or implemented to date are based on collision avoidance handshakes between sender and receiver The key objective of collision avoidance handshakes is reducing or eliminating the collision of data packets from a source at any given receiver due to interference from packets from other sources In the vast majority of these protocols including the IEEE 802 11 standard the handshake is sender initiated in that the sender asks the receiver for permission to transmit using a short control packet and transmits only after the receiver sends a short clear to send notification There are two main objectives in this work analyze the effect of reversing the collision avoidance handshake as a way to improve the performance of MAC protocols under any conditions in the network and design MAC protocols that provide correct floor acquisition without carrier sensing or code pre assignment We show that receiver initiated collision avoidance MAC protocols not only outperform any sender initiated ones but also guarantee collision free data transmission and seamless support for mobility by using simple low cost wireless radios We study the effect of persistent carrier sensing in receiver as well as sender initiated MAC protocols We extend our work to multi channel radios and introduce novel collision avoidance MAC protocols that eliminate the need for carrier sensing and code pre assignment and improve the utilization of the medium in the presence of unicast multicast and broadcast traffic

Multiaccess, Mobility and Teletraffic in Wireless

Communications: Volume 4 Ezio Biglieri,Luigi Fratta,Bijan Jabbari,2013-03-09 The unrelenting growth of wireless communications continues to raise new research and development problems that require unprecedented interactions among communication engineers In particular specialists in transmission and specialists in networks must often cross each other's boundaries This is especially true for CDMA an access technique that is being widely accepted as a system solution for next generation mobile cellular systems but it extends to other system aspects as well Major challenges lie ahead from the design of physical and radio access to network architecture resource management mobility management and capacity and performance aspects Several of these aspects are addressed in this volume the fourth in the edited series on Multiaccess Mobility and Teletraffic for Wireless Communications It contains papers selected from MMT 99 the fifth Workshop held on these topics in October 1999 in Venezia Italy The focus of this workshop series is on identifying presenting and discussing the theoretical and implementation issues critical to the design of wireless communication networks More specifically these issues are examined from the viewpoint of the impact each one of them can have on the others Specific emphasis is given to the evolutionary trends of universal wireless access and software radio Performance improvements achieved by spectrally efficient codes and smart antennas in experimental GSM testbeds are presented Several contributions address critical issues regarding multimedia services for Third Generation Mobile Radio Networks ranging from high rate data transmission with CDMA technology to resource allocation for integrated Voice WWW traffic

Wireless Internet Access over GSM and UMTS

Manfred Taferner,Ernst Bonek,2013-06-29 We dedicate this book to students of computer science who want to understand why the radio channel is at the heart of mobile communications be it data or voice and to students of communications engineering looking for an introduction to the structure of the Internet protocols and their application to mobile radio We also welcome the practicing engineer working for mobile network operators and infrastructure suppliers and the application programmer looking for the underlying reasons for the problems they encounter in their daily work Given that convergence of the information technology and communications worlds has been talked about for almost 20 years there is still surprisingly little knowledge among specialists of each other's fields Data communications over radio notably Internet access however requires fundamental understanding of both fields Internet protocols have been designed for fixed networks There bit errors are so rare that interrupted transmission almost inevitably means congestion In contrast the radio channel constitutes a bottleneck for mobile data communications in that it introduces bit errors even at modest data rates This book is based on the doctoral thesis of one of us M Taferner
