Optimization And Industry:

Optimization In Industry T. A. J. Nicholson, 2007-11 The origin of any industrial optimization study lies in the theory that some improvement can be made in a controllable system. The possibility for improvements may arise in any context for example in the control of a chemical plant the organization of production to meet delivery dates the design of rubber compounds in traffic signal settings and so on. In this volume T A J Nicholson deals with applications of the industrial optimization techniques demonstrated in the first volume of this two part project Optimization in Industry Optimization Techniques. Applications are classified by their main functional areas in industrial planning design and control. The fields covered are machine sequencing stock control and scheduling plant renewal distribution financial problems and chemical process control and design. These last two in particular are subjects often overlooked in operations research curricula. In each field the place and status of optimization techniques is first described and then a wide range of realistic case studies and examples are reviewed many of them international. The problems given in this volume are primarily concerned with formulation not with solution the task is to formulate the problems to be solved by one or more of the methods described in volume one. By connecting the optimization techniques with their applications the gap between the people devising the methods and the people who actually need to use them is bridged. As with the first volume this text is also supported by new exercises and model answers making this book important as an introduction to the application of optimization techniques for students as well as a reference work for the practitioner. T A J Nicholson is senior lecturer at the London School of Business Studies with research and consulting interests in industrial control systems.

Optimization in Industry T.A.J.

Nicholson, 2017-07-12 As optimization techniques have developed a gap has arisen between the people devising the methods and the people who actually need to use them. Research into methods is necessarily long term and located usually in academic establishments whereas the application of an optimization technique normally in an industrial environment has to be justified financially in the short term. The gap is probably inevitable but there is no need for textbooks to reflect it. Teaching of optimization techniques separately from their connection with applications is pointless. This book gives a detailed exposition of the techniques. In this first volume T A J Nicholson demonstrates the full range of techniques available to the practitioner for the solution of varying problems. For each technique the background reasoning behind its development is explained in simple terms where helpful it is supported by a geometrical argument and the iterative algorithm for finding the optimum is defined clearly. These steps enable the reader not only to see plainly what is happening in the method but also to reach a level of understanding necessary to write computer programs for optimization techniques. Problems are tackled in the same way by searching a feasible region for an optimum. This approach helps the reader to develop the most essential of all skills selecting appropriate techniques for different circumstances. The numerous worked examples in the text supported by worked solutions and the exercises at the end of the chapters are important aids to learning and to teachers. This book
