Abstract

Coal combustion can lead to emissions of organic compounds to the atmosphere, if the combustion system is inefficient. International protocols on emissions of some organic species have been established due to concern with respect to their role in ground level ozone formation and potential human health effects. These protocols acknowledge that efficient coal combustion in large coal-fired power plants is a negligible source of organic emissions. However, coal use in less efficient sectors such as residential stoves and some industrial practices can be a significant source of local emissions.

Evaluating emissions of organic compounds from sources such as coal combustion can be difficult due to the low concentrations and the large number of different compounds released. Emission inventories are commonly based on emission factors. This report reviews data on emissions from coal combustion from large-scale pulverised units down to small residential stoves. Emissions from industrial coal use such as for coke manufacture, metal production and cement kilns are also included. The effects of parameters such as fuel type, combustion conditions and pollution control systems are summarised. Best practices, many of which concentrate on increasing efficiency, are reviewed for all coal-related sources.

Neilson, 1997-12-11 Environmental Chemistry is a relatively young science Interest in this subject however is growing very rapidly and although no agreement has been reached as yet about the exact content and limits of this interdisciplinary discipline there appears to be increasing interest in seeing environmental topics which are based on chemistry embodied in this subject One of the first objectives of Environmental Chemistry must be the study of the environment and of natural chemical processes which occur in the environment A major purpose of this series on Environmental Chemistry therefore is to present a reasonably uniform view of various aspects of the chemistry of the environment and chemical reactions occurring in the environment The industrial activities of man have given a new dimension to Environmental Chemistry We have now synthesized and described over five million chemical compounds and chemical industry produces about hundred and fifty million tons of synthetic chemicals annually We ship billions of tons of oil per year and through mining operations and other geophysical modifications large quantities of inorganic and organic materials are released from their natural deposits Cities and metropolitan areas of up to 15 million inhabitants produce large quantities of waste in relatively small and confined areas Much of the chemical products and waste products of modern society are released into the environment either during production storage transport use or ultimate disposal These released materials participate in natural cycles and reactions and frequently lead to interference and disturbance of natural systems **Treatise on General and Industrial Organic Chemistry** Ettore Molinari, 1913 **Journal of the Society of Chemical Industry**, 1908 Bulletin of the Imperial Institute Imperial Institute (Great Britain), 1925 **Journal of the Society of Chemical Industry** Society of Chemical Industry (Great Britain), 1899 Includes list of members 1882 1902 and proceedings of the annual meetings and various supplements The Industrial Chemist and Chemical Manufacturer, 1930 **Power from Coal - where to Remove Impurities?** Gordon R.
