procedure euler (fct, sum, eps, tim) ; value eps, tim ; integer tim ;
real procedure fct ; real sum, eps ;
comment euler computes the sum of fct(i) for i from zero up to infinity
by means of a suitably refined euler transformation. The summation is
stopped as soon as tim times in succession the absolute value of the
terms of the transformed series are found to be less than eps. Hence,
one should provide a function fct with one integer argument, an upper
bound eps, and an integer tim. The output is the sum sum. euler is
particularly efficient in the case of a slowly convergent or divergent
alternating series ;
begin integer i, k, n, t ; array m[0:15] ; real mn, mp, ds ;
i := n := t := 0; m[0] := fct(0) ; sum := m[0]/2 ;
nextterm: i := i+1 ; mn := fct(i) ;
    for k := 0 step 1 until n do
        begin mp := (mn+m[k])/2 ; m[k] := mn ; mn := mp end means ;
    if (abs(mn) < abs(m[n]))\wedge(n<15) then
        begin ds := mn/2 ; n := n+1 ; m[n] := mn end accept
    else ds := mn ;
    sum := sum + ds ;
    if abs(ds) < eps then t:=t+1 else t := 0 ;
    if t<tim then go to nextterm
end euler

**for Computer-Implemented Inventions** Sabine Kruspijg, Claudia Schwarz, 2016-04-24 As a result of the incorporation of computer software into countless commercial and industrial products the patentability of software has become a vital issue in intellectual property law. This indispensable book provides an overview on the current status of computer implemented inventions in patent law across Europe and major jurisdictions worldwide. A hugely practical field research tool with guidance based on case law it examines the major hurdles in each particular country and describes the best practice to be adopted. Clearly showing how enforceable software patent applications can be competitively drafted and how a patent portfolio for computer implemented inventions can be established in several countries without spending money unnecessarily on problematic examination proceedings this book covers such issues and topics as the following: claim categories for patent applications, sufficient level of abstraction, breadth of the claimed invention, fundamental terms of computing and terminological traps, probability for patents dependent on software application areas and patents in core areas of computing. With separate chapters for the key countries Germany, the United Kingdom, France, the United States, China, Korea, Japan, India and the European Patent Office the legal situation for computer implemented inventions in each country or region this book includes guidance on prosecution under national law, analyses of relevant court decisions, practice checklists and an outlook on future developments. The authors describe claim formulation based on actual cases and on principles of computer science in order to show what might be or might not be patentable in each jurisdiction. With this incomparable resource patent attorneys and patent professionals in companies will get a basis for making decisions about the most appropriate jurisdictions in which to file patent applications. This book will also be of great value to computer professionals who are affected by the protection of software or who are actively involved in the protection of software by patent law.
