Methods Of Shapepreserving Spline Approximation:

Methods of Shape-preserving Spline Approximation Boris I. Kvasov, 2000 This book aims to develop algorithms of shape preserving spline approximation for curves surfaces with automatic choice of the tension parameters The resulting curves surfaces retain geometric properties of the initial data such as positivity monotonicity convexity linear and planar sections The main tools used are generalized tension splines and B splines A difference method for constructing tension splines is also developed which permits one to avoid the computation of hyperbolic functions and provides other computational advantages The algorithms of monotonizing parametrization described improve an adequate representation of the resulting shape preserving curves surfaces Detailed descriptions of algorithms are given with a strong emphasis on their computer implementation These algorithms can be applied to solve many problems in computer aided geometric design **Two Dimensional Spline Interpolation Algorithms** Helmuth Späth, 1993-05-31 These volumes present a practical introduction to computing spline functions the fundamental tools for fitting curves and surfaces in computer aided design CAD and computer graphics **Visual Informatics: Bridging Research and Practice** Halimah Badioze Zaman, Peter Robinson, Maria Petrou, Patrick Olivier, Heiko Schröder, 2009-11-02 This book constitutes the refereed proceedings of the First International Visual Informatics Conference IVIC 2009 held in Kuala Lumpur Malaysia in November 2009 The 82 revised research papers presented together with four invited keynote papers were carefully reviewed and selected from 216 submissions The papers are organized in topical sections on virtual technologies and systems virtual environment visualization engineering and simulation as well as visual culture services and society *Handbook of Computational Economics* Karl Schmedders, Kenneth L. Judd, 2013-12-31 Handbook of Computational Economics summarizes recent advances in economic thought revealing some of the potential offered by modern computational methods With computational power increasing in hardware and algorithms many economists are closing the gap between economic practice and the frontiers of computational mathematics In their efforts to accelerate the incorporation of computational power into mainstream research contributors to this volume update the improvements in algorithms that have sharpened econometric tools solution methods for dynamic optimization and equilibrium models and applications to public finance macroeconomics and auctions They also cover the switch to massive parallelism in the creation of more powerful computers with advances in the development of high power and high throughput computing Much more can be done to expand the value of computational modeling in economics In conjunction with volume one 1996 and volume two 2006 this volume offers a remarkable picture of the recent development of economics as a science as well as an exciting preview of its future potential Samples different styles and approaches reflecting the breadth of computational economics as practiced today Focuses on problems with few well developed solutions in the literature of other disciplines Emphasizes the potential for increasing the value of computational modeling in economics **Shape-Preserving Approximation by Real and Complex Polynomials**
