*Methods of Surface Analysis* A.W. Czanderna, 2012-12-02 *Methods of Surface Analysis* deals with the determination of the composition of surfaces and the identification of species attached to the surface. The text applies methods of surface analysis to obtain a composition depth profile after various stages of ion etching or sputtering. The composition at the solid/solid interface is revealed by systematically removing atomic planes until the interface of interest is reached, in which the investigator can then determine its composition. The book reviews the effect of ion etching on the results obtained by any method of surface analysis, including the effect of the rate of etching, incident energy of the bombarding ion, the properties of the solid, the effect of the ion etching on generating an output signal of electrons, ions or neutrals. The text also describes the effect of the residual gases in the vacuum environment. The book considers the influence of the sample geometry, of the type of metal, insulator, semiconductor, organic and of the atomic number, which can have on surface analysis. The text describes in detail low energy ion scattering spectroscopy, X-ray photoelectron spectroscopy, Auger electron spectroscopy, secondary ion mass spectroscopy and infrared reflection absorption spectroscopy. The book can prove useful for researchers, technicians and scientists whose works involve organic chemistry, analytical chemistry and other related fields of chemistry such as physical chemistry or inorganic chemistry. **Methods of Surface Analysis** J. **Analysis** Alvin Warren Czanderna, 1975 *Methods of Surface Analysis* **Secondary Ion Mass Spectrometry SIMS III** A. Benninghoven, J. Giber, J. Laszlo, M. Riedel, H.W. Werner, 2012-12-06 Following the biannual meetings in Münster 1977 and Stanford 1979, the Third International Conference on Secondary Ion Mass Spectroscopy was held in Budapest from August 31 to September 5, 1981. The Conference was attended by about 250 participants. The success of the 1981 Conference in Budapest was especially due to the excellent preparation and organization by the Local Organizing Committee. We would also like to acknowledge the generous hospitality and cooperation of the Hungarian Academy of Sciences. Japan was chosen to be the location for the next conference in 1983. SIMS conferences are devoted to two main issues: improving the application of SIMS in different and especially new fields and understanding the ion formation process. Needless to say, there is a very strong interaction between these two issues. The major reason for the rapid increase in SIMS activities in the last few years is the fact that SIMS is a powerful tool for bulk, thin film and surface analysis. Today it is extensively and successfully applied in such different fields as depth profiling and imaging of semiconductor devices, in isotope analysis of minerals, in imaging biological tissues, in the study of catalysts and catalytic reactions, in oxide layer analysis on metals, in drug detection and in the analysis of body fluids. **Analytical Methods In Corrosion Science and Engineering** Philippe Marcus, Florian B.
