Parliament lords, proc, Vict, 1862 **Regulatory Networks in Stem Cells** Vinagolu K. Rajasekhar, 2009-03-04 Stem cells appear to be fundamental cellular units associated with the origin of multicellular organisms and have evolved to function in safeguarding the cellular homeostasis in organ t sues The characteristics of stem cells that distinguish them from other cells

have been the fascinating subjects of stem cell research. The important properties of stem cells such as maintenance of quiescence, self-renewal capacity and differentiation potential have propelled this exciting field and presently form a common theme of research in developmental biology and medicine. The derivation of pluripotent embryonic stem cells, the prospective identification of multipotent adult stem cells and more recently the induced pluripotent stem cells, popularly called iPS, are important milestones in the arena of stem cell biology. Complex networks of transcription factors, different signaling molecules and the interaction of genetic and epigenetic events constantly modulate stem cell behavior to evoke programming and reprogramming processes in normal tissue homeostasis during development. In any given cellular scenario, the regulatory networks can pose considerable complexity and yet exert an orderly control of stem cell differentiation during normal development. An aberration in these finely tuned processes during development usually results in a spectrum of diseases such as cancers and neurological disorders. This underscores the imminent need for a more complete understanding of molecular mechanisms underlying the regulatory circuitries required for stem cell maintenance. Over the past 3-5 years, a diverse group of bench and physician-scientists have prospectively enhanced our knowledge of stem cell biology. These studies are unveiling many unrecognized or previously unknown fundamentals of developmental biology.
