**Proportions and Rates** U.S. Department of Health and Human Services,Agency for and Quality,2014-01-23 Meta analyses of proportions or rates e g incidence rates are very often included in reports generated by the Effective Health Care Program and in systematic reviews in general For example one would use a meta analysis of proportions to calculate the summary frequency of adverse or harmful events Depending on the clinical context adverse events can be rare e g the incidence rate of rhabdomyolysis in statin treated patients is approximately 3 3 events per 100 000 patient years or quite common e g the average percentage of nausea and vomiting in chemotherapy treated cancer patients was 48 percent in a meta analysis of randomized trials Meta analysis of proportions can also be applied to evaluate medical test performance Although a bivariate meta analysis of sensitivity and specificity or summarization with a hierarchical summary operating characteristic curve is commonly recommended separate univariate meta analyses may be sufficient when there is little variation in either sensitivity or specificity To help provide guidance for meta analysts we performed an extensive simulation study to assess the
