 This book espouses an innovative theory of scientific realism in which due weight is given to mathematics and logic The
 authors argue that mathematics can be understood realistically if it is seen to be the study of universals of properties and
 relations of patterns and structures the kinds of things which can be in several places at once Taking this kind of scientific
 platonism as their point of departure they show how the theory of universals can account for probability laws of nature
 causation and explanation and explore the consequences in all these fields This will be an important book for all philosophers
 of science logicians and metaphysicians and their graduate students The readership will also include those outside
 philosophy interested in the interrelationship of philosophy and science *Catalogue of Scientific Papers (1800-1900): ser. 2*
