## **Marston Morse Selected Papers:**

*Selected Papers* Marston Morse, 2015-10-26 From the Introduction Marston Morse was born in 1892 so that he was 33 years old when in 1925 his paper Relations between the critical points of a real valued function of  $n$  independent variables appeared in the Transactions of the American Mathematical Society. Thus Morse grew to maturity just at the time when the subject of Analysis Situs was being shaped by such masters as Poincaré, Veblen, L E J Brouwer, G D Birkhoff, Lefschetz and Alexander and it was Morse's genius and destiny to discover one of the most beautiful and far reaching relations between this fledgling and Analysis, a relation which is now known as Morse Theory. In retrospect all great ideas take on a certain simplicity and inevitability partly because they shape the whole subsequent development of the subject. And so to us today Morse Theory seems natural and inevitable. This whole flight of ideas was of course acclaimed by the mathematical World it eventually earned him practically every honor of the mathematical community over twenty honorary degrees the National Science Medal the Legion of Honor of France. *The Goldbach Conjecture* Yuan Wang, 2002 This book provides a detailed description of a most important unsolved mathematical problem — the Goldbach conjecture. Raised in 1742 in a letter from Goldbach to Euler this conjecture attracted the attention of many mathematical geniuses. Several great achievements were made but only until the 1920s. The book gives an exposition of these results and their impact on mathematics particularly number theory. It also presents partly or wholly selections from important literature so that readers can get a full picture of the conjecture. *Goldbach Conjecture, 2nd Edition* Yuan Wang, 2002-11-20 This book provides a detailed description of a most important unsolved mathematical problem — the Goldbach conjecture. Raised in 1742 in a letter from Goldbach to Euler this conjecture attracted the attention of many mathematical geniuses. Several great achievements were made but only until the 1920s. The book gives an exposition of these results and their impact on mathematics particularly number theory. It also presents partly or wholly selections from important literature so that readers can get a full picture of the conjecture.

*Structuralism And Structures* Charles E Rickart, 1995-02-20 This book is devoted to an analysis of the way that structures must enter into a serious study of any subject and the term structuralism refers to the general method of approaching a subject from the viewpoint of structure. A proper appreciation of this approach requires a deeper understanding of the concept of structure than is provided by the simple intuitive notion of structures that everyone possesses to some degree. Therefore a large part of the discussion is devoted directly or indirectly to a study of the nature of structures themselves. A formal definition of a structure plus some basic general properties and examples is given early in the discussion. Also in order to clarify the general notions and to see how they are used the later chapters are devoted to an examination of how structures enter into some special fields including linguistics, mental phenomena, mathematics and its applications and biology especially in the theory of evolution. Because the author is a mathematician certain mathematical ideas have influenced greatly the choice and approach to the material covered. In general however the mathematical influence is not on

a technical level and is often only implicit Even the chapter on mathematical structures is nontechnical and is about rather than on mathematics Only in the last chapter and earlier in three short sections does one find any of the expected formal mathematics In other words the great bulk of the material is accessible to someone without a mathematical background

Euler Through Time V. S. Varadarajan, 2006 Euler is one of the greatest and most prolific mathematicians of all time He wrote the first accessible books on calculus created the theory of circular functions and discovered new areas of research such as elliptic integrals the calculus of variations graph theory divergent series and so on It took hundreds of years for his successors to develop in full the theories he began and some of his themes are still at the center of today's mathematics It is of great interest therefore to examine his work and its relation to current mathematics This book attempts to do that In number theory the discoveries he made empirically would require for their eventual understanding such sophisticated developments as the reciprocity laws and class field theory His pioneering work on elliptic integrals is the precursor of the modern theory of abelian functions and abelian integrals His evaluation of zeta and multizeta values is not only a fantastic and exciting story but very relevant to us because they are at the confluence of much research in algebraic geometry and number theory today Chapters 2 and 3 of the book Anticipating his successors by more than a century Euler created a theory of summation of series that do not converge in the traditional manner Chapter 5 of the book treats the progression of ideas regarding divergent series from Euler to many parts of modern analysis and quantum physics The last chapter contains a brief treatment of Euler products Euler discovered the product formula over the primes for the zeta function as well as for a small number of what are now called Dirichlet L functions Here the book goes into the development of the theory of such Euler products and the role they play in number theory thus offering the reader a glimpse of current developments the Langlands program

**Translation Generalized Quadrangles** Joseph Adolf Thas, Koen Thas, H. van Maldeghem, 2006 Translation generalized quadrangles play a key role in the theory of generalized quadrangles comparable to the role of translation planes in the theory of projective and affine planes The notion of translation generalized quadrangle is a local analogue of the more global Moufang Condition a topic of great interest also due to the classification of all Moufang polygons Attention is thus paid to recent results in that direction but also many of the most important results in the general theory of generalized quadrangles that appeared since 1984 are treated Translation Generalized Quadrangles is essentially self contained as the reader is only expected to be familiar with some basic facts on finite generalized quadrangles Proofs that are either too long or too technical are left out or just sketched The three standard works on generalized quadrangles are co authored by the writers of this book Finite Generalized Quadrangles 1984 by S E Payne and J A Thas Generalized Polygons 1998 by H Van Maldeghem and Symmetry in Finite Generalized Quadrangles 2004 by K Thas

*Complex Variable Methods In Plane Elasticity* Jian-ke Lu, 1995-09-30 This book deals systematically with the mathematical theory of plane elasto statics by using complex variable methods together with many results originated by the author The problems considered are

reduced to integral equations Fredholm or singular which are rigorously proved to be uniquely solvable Particular attention is paid to the subjects of crack problems in the quite general case especially those of composite media which are solved by a unified method The methods used in this book are constructive so that they may be used in practice     **Almost Complex and Complex Structures** C. C. Hsiung, 1995 This book gives a self contained fundamental study of the subject Besides the following special features it contains the author's detailed solution to the long standing unsolved problem in the theory of complex manifolds Does there exist a complex structure on the six sphere The special features of the book are a classification of almost complex and similarly almost Hermitian structures together with inclusion relations discussions about various known almost Hermitian structures a necessary and sufficient condition for a general almost Hermitian manifold to have constant holomorphic sectional or bisectional curvature and similar conditions for various special almost Hermitian manifolds some complex Laplacians together with some of their relationships with the real Laplacian the spectral geometry of Riemannian manifolds and some general almost Hermitian manifolds including Kählerian manifolds as a special case conditions for an almost complex structure to be a complex structure some vanishing theorems for Riemannian and almost Hermitian manifolds     **Notices of the American Mathematical Society** American Mathematical Society, 1982

**Selected Papers on Geometry** Raymond Woodward Brink, 1979     **History of Topology** I.M. James, 1999-08-24 Topology for many years has been one of the most exciting and influential fields of research in modern mathematics Although its origins may be traced back several hundred years it was Poincaré who gave topology wings in a classic series of articles published around the turn of the century While the earlier history sometimes called the prehistory is also considered this volume is mainly concerned with the more recent history of topology from Poincaré onwards As will be seen from the list of contents the articles cover a wide range of topics Some are more technical than others but the reader without a great deal of technical knowledge should still find most of the articles accessible Some are written by professional historians of mathematics others by historically minded mathematicians who tend to have a different viewpoint     **Revue Roumaine de Mathématiques Pures Et Appliquées** , 1983     **Directory of Women in the Mathematical Sciences** , 1981     Reviews in Global Analysis, 1980-86 as Printed in Mathematical Reviews , 1988     **The Matrix and Tensor Quarterly** , 1982

**National Union Catalog** , 1968 Includes entries for maps and atlases     International mathematical news , 1988
