## **Metal Containing Polymeric Systems:**

**Metal-Containing Polymeric Systems** John E. Sheats, Charles E. Carraher Jr., Charles U. Pittman, 2012-12-06 Research on metal containing polymers began in the early 1960s when several workers found that vinyl ferrocene and other vinylic transition metal complexes would undergo polymerization under the same conditions as conventional organic monomers to form high polymers which incorporated a potentially reactive metal as an integral part of the polymer structures. Some of these materials could act as semiconductors and possessed one or two dimensional conductivity. Thus applications in electronics could be visualized immediately. Other workers found that reactions used to make simple metal chelates could be used to prepare polymers if the ligands were designed properly. As interest in homogeneous catalysts developed in the late 60s and early 70s several investigators began binding homogeneous catalysts onto polymers where the advantage of homogeneous catalysis known reaction mechanisms and the advantage of heterogeneous catalysis simplicity and ease of recovery of catalysts could both be obtained. Indeed the polymer matrix itself often enhanced the selectivity of the catalyst.

**Frontiers in Transition Metal-Containing Polymers** Alaa S. Abd-El-Aziz, Ian Manners, 2006-10-25 A detailed up to date review of transition metal containing polymers.
