Metallocenes In Stereoselective Synthesis:

Metallocenes in Regio- and Stereoselective Synthesis Tamotsu Takahashi, K. Kanno, 2005-01-12 Metallocene is a well known sandwich complex with two cyclopentadienyl ligands such as ferrocene. Recently such metallocene compounds have been found to be very characteristic and they have become very important not only in the area of organic synthesis but also in polymerization in industry. Metal complexes with one cyclopentadienyl ligand have also become popular as half sandwich complexes. The number of researchers in the field of metallocenes has increased rapidly. However, the origin of the characteristic reactivity of metallocenes is not fully understood. In this volume, the chemistry of metal complexes with at least one cyclopentadienyl ligand is comprehensively covered by leading experts. Reactions discussed here are: i) natural product synthesis, ii) catalytic asymmetric synthesis, iii) cyclization reactions, iv) catalytic reactions, v) polymerization reactions, and vi) carbon-carbon bond cleavage reactions. The reader will have access to useful information about the current state of metallocene chemistry. *Stereoselective Polymerization with Single-Site Catalysts* Lisa S. Baugh, Jo Ann M.

Canich, 2007-11-29 New synthetic techniques allow chemists to modify polymer microstructures more precisely than ever, making it possible to design materials that meet increasingly demanding performance requirements. Written and edited by experts in the field, *Stereoselective Polymerization with Single Site Catalysts* reviews how the relative stereochemistry of

Metallocenes Antonio Togni, Ronald L. Halterman, 1998-10-15 That terms like sandwich complexes or the concept of compounds without direct chemical bonds between the central metal atom and the ligating atoms are nowadays common knowledge can be attributed to the sensational discovery of ferrocene in the early 1950s. Although ferrocene is still at the forefront of research, this two volume book highlights the development of metallocene chemistry and emphasizes the similarities and differences between ferrocene and other metallocenes. Do you require a transition metal to build metallocenes? Must the planes of the cyclopentadienyl ligands be parallel to allow the compound to behave like a typical metallocene? Do zirconocenes react by the same mechanism as molybdenocenes? What are the potential applications of these substances? Let yourself be guided by the leading experts in this field and learn all about the synthesis, reactivity, and unique properties of these sandwich complexes. If you are more interested in applications, there is a wealth of polymeric and dendritic materials with metallocene building blocks described herein. This book also focusses on metallocenes as catalysts in polymerization or asymmetric reactions. If you are a graduate student or researcher in organic, inorganic, organometallic, polymer chemistry, and materials science, you will find this book an inspiring source of ideas for your own research.

Bioorganometallic Chemistry G. Simonneaux, 2006-05-23 Bioorganometallic Chemistry has become a mature area of science and is comprehensively covered by leading experts in this book. Research in this rapidly developing transdisciplinary field is having profound influence on other areas of scientific investigation ranging from catalytic organic synthesis to biology, medicine, and material science. This book provides a balanced view of this rapidly developing and promising subject.
