Model Systems In Biological Psychiatry:

Model Systems in Biology Georg F. Striedter, 2022-08-02 How biomedical research using various animal species and in vitro cellular systems has resulted in both major successes and translational failure In *Model Systems in Biology* comparative neurobiologist Georg Striedter examines how biomedical researchers have used animal species and in vitro cellular systems to understand and develop treatments for human diseases ranging from cancer and polio to Alzheimer's disease and schizophrenia Although there have been some major successes much of this translational research on model systems has failed to generalize to humans Striedter explores the history of such research focusing on the models used and considering the question of model selection from a variety of perspectives the philosophical the historical and that of practicing biologists Striedter reviews some philosophical concepts and ethical issues including concerns over animal suffering and the compromises that result He traces the history of the most widely used animal and in vitro models describing how they compete with one another in a changing ecosystem of models He examines how therapies for bacterial and viral infections cancer cardiovascular diseases and neurological disorders have been developed using animal and cell culture models and how research into these diseases has both taken advantage of and been hindered by model system differences Finally Striedter argues for a big tent biology in which a diverse set of models and research strategies can coexist productively

Conditioning in Psychiatric Conditions - State of the Field and Future Directions Tracy L. Greer, Lucien T.

Thompson, 2017-09-22 Eyeblink classical conditioning EBC is a model paradigm for associative also termed Pavlovian learning one of the simplest and best understood forms of learning and memory Because EBC paradigms are readily adapted across species the neural substrates of EBC have been well characterized and include but are not limited to the cerebellum and anterior interpositus nucleus the hippocampus and prefrontal cortices The ability to collect EBC data across many different species i e including but not limited to humans also has the distinct advantage of facilitating translational research and therefore may be of particular benefit to elucidate mechanistic changes associated with a wide variety of psychiatric disorders In fact EBC paradigms have been employed to assess individuals with a wide range of neurological deficits including Korsakoff's amnesia Alzheimer's disease as well as normal aging dyslexia inflammatory tremor dystonia and multiple sclerosis and psychiatric disorders including major depressive disorder anxiety disorders schizophrenia autism and alcohol use addiction disorders Individuals with these disorders exhibit differential impairments across different EBC task types e g delay vs trace EBC with some showing impairment in one but not the other task and some showing impairments in both across learning stage e g acquisition discrimination or extinction and across response variables e g magnitude and timing of the conditioned eyeblink motor response modality of the conditioned stimulus Evaluating specific individual differences in the context of variable brain pathology should aid characterization and refinement of our understanding of complex neuropsychiatric disorders The field of psychiatry has seen a transition from more traditional use of symptom clusters to define psychiatric disorders with subsequent examination of associated behaviors and traits to the use of physiological and behavioral indicators to characterize individuals with respect to various psychological domains in line with the National Institute of Mental Health Research Domain Criteria RDoC initiative This approach employs a neuroscience based framework to assess the pathophysiology of chronic mental illnesses Behavioral and cognitive processes are critical domains of interest in evaluating potential maladaptive patterns that may be indicative of specific psychopathologies Furthermore the rapid development of technological advances that allow for more detailed examination e g EEG MEG MRI fMRI infrared imaging and manipulation e g transcranial magnetic and direct current stimulation of brain functions should enhance our ability to better characterize EBC performance and its utility in characterizing aspects of particular neuropathologies Substantial research evidence exists for the value of EBC paradigms to inform our understanding of the pathophysiologies underlying a wide variety of neurological and psychiatric disorders Despite these findings this readily implemented classic cognitive behavioral paradigm is relatively underutilized in clinical settings This e book highlights recent convergence of clinical and research efforts in this area and aims to promote a resurgent interest in eyeblink classical conditioning and to emphasize the potential for future translational and diagnostic applications of EBC in combination with
