Artificial War: Multiagent-based Simulation Of Combat Andrew Ilachinski, 2004-06-14 Military conflicts particularly land combat possess the characteristics of complex adaptive systems combat forces are composed of a large number of nonlinearly interacting parts and are organized in a dynamic command and control network local action which often appears disordered self organizes into long range order military conflicts by their nature proceed far from equilibrium military forces adapt to a changing combat environment and there is no master voice that dictates the actions of every soldier i e battlefield action is decentralized Nonetheless most modern state of the art military simulations ignore the self organizing properties of combat This book summarizes the results of a multiyear research effort aimed at exploring the applicability of complex adaptive systems theory to the study of warfare and introduces a sophisticated multiagent based simulation of combat called EINSTEIN EINSTEIN whose bottom up generative approach to modeling combat stands in stark contrast to the top down or reductionist philosophy that still underlies most conventional military models is designed to illustrate how many aspects of land combat may be understood as self organized emergent phenomena Used worldwide by the military operations research community EINSTEIN has pioneered the simulation of combat on a small to medium scale by using autonomous agents to model

Ronald Samuel Chong, 1998 Abstract People demonstrate a remarkable ability to perform complex multiple task activities in
spite of the limitations of our sensory perceptual cognitive and motor systems A prominent theory that addresses how
multiple tasks activities are performed is that of the executive process Some of the functions of the executive process include
enforcing task priorities and arbitrating access to limited resources It has been shown that a time sharing skill or executive
process knowledge is acquired during training on dual task combinations This dissertation presents the development of a
computational task independent framework for modeling the acquisition of the knowledge acquired during training on dual
task combinations executive process knowledge On a selected dual task combination a continuous tracking task and a
discrete two choice reaction time task this framework when given the declarative and procedural representation of the
novice task has produced an expert model whose performance is a good match to empirical reaction time and tracking error
data for the task combination There are three main contributions of this work First is the development of EPIC Soar a
symbolic hybrid architecture that possesses a psychologically motivated learning mechanism and psychologically plausible
perception and motor systems Second is the identification and classification of executive process knowledge and the
taxonomies that result from this analysis Third is an acquisition framework which consists of a novel data structure for
representing task strategies a task independent procedure for resolving simultaneous access for motor resources and

learning new knowledge that avoids such collisions in the future a second task independent learning procedure which refines the strategy data structure and creates new procedural knowledge for performing the task and a collection of guidelines that regulate how and when promotions are applied *The Proceedings of the 2002 Summer Computer Simulation Conference* Jeffrey Wallace,2002 *HCI Models, Theories, and Frameworks* John M. Improving Soldier Factors in Prediction Models Rick Archer,2002 Report developed under SBIR contract for topic A98 163 A key decision made at the highest levels of any military is the trade off between allocating resources to system acquisition versus allocating resources to maintain force readiness through training Advanced Distributed Simulations ADS provide a mechanism for tactical combat training through man in the loop simulators and Computer Generated Forces CGF The potential for using ADS to address the trade offs for allocating resources is dampened by the unrealistic behavior of CGF Phase 1 of this project produced algorithms data structures and a methodology for incorporating the effects of training and environmental stressors to improve CGF behavioral realism in Phase 11 we expanded and enhanced the technical feasibility for including these effects in CGF entities on simulated battlefields The resulting product is called the Training Effects and Stressor Integration Module TESTIM it can provide the Army with the ability to improve the realism of CGF entities in ADS and other human performance models TESTIM can also be used to assess the expected payoff of training in terms of improved performance DTIC **Behavioral Modeling and Simulation** National Research Council,Division of Behavioral and Social Sciences and Education,Board on Behavioral, Cognitive, and Sensory Sciences,Committee on Organizational Modeling: From Individuals to Societies,2008-07-04 Today s military missions have shifted away from fighting nation states using conventional weapons toward combating insurgents and terrorist networks in a battlespace in which the attitudes and behaviors of civilian noncombatants may be the primary effects of military actions To support these new missions the military services are increasingly interested in using models of the behavior of humans as individuals and in groups of various kinds and sizes Behavioral Modeling and Simulation reviews relevant individual organizational and societal IOS modeling research programs evaluates the strengths and weaknesses of the programs and their methodologies determines which have the greatest potential for military use and provides guidance for the design of a research program to effectively foster the development of IOS models useful to the military This book will be of interest to model developers operational military users of the models and their managers and government personnel making funding decisions regarding model development

Human Factors Impacts in Air Traffic Management Barry Kirwan,Mark Rodgers,Dirk Schäfer,2005 In research and application of Human Factors in Air Traffic Management ATM systems design development and operation there remains a lack of clarity regarding the range and integration of activities associated with the need for greater attention to issues such

as human error interface design and teamwork especially in systems with increased levels of automation This book seeks to redress this situation by presenting case studies of human factors applications in which there is demonstrable success in terms of improvement in operational systems Individual examples are used to outline how each human factors study evolved what it entailed how it was resourced and how the results contributed to operational performance Case studies include training methods human error team resource management situation assessment terminal automation replacement systems collaborative decision making to improve the effectiveness of traffic flow management and the role of human factors in ATM
