Qualitative Modeling of Complex Systems Charles J. Puccia, Richard Levins, 1985 In this modern era of mathematical modeling applications have become increasingly complicated As the complexity grows it becomes more and more difficult to draw meaningful conclusions about the behavior of theoretical models and their relations to reality Alongside methods that emphasize quantitative properties and the testing of scientific details there is a need for approaches that are more qualitative These techniques attempt to cover whole families of models in one bold stroke in a manner that allows robust conclusions to be drawn about them Loop analysis and time averaging provide a means of interpreting the properties of systems from the network of interactions within the system The authors methodology concentrates on graphical representation to guide experimental design to identify sources of external variability from the statistical pattern of variables and to make management decisions Although most of the examples are drawn from ecology the methods are relevant to all of the pure and applied sciences This relevance is enhanced by case studies from such diverse areas as physiology resource management the behavioral sciences and social epidemiology The book will be useful to a broad readership from the biological and social sciences as well as the physical sciences and technology It will interest undergraduate and graduate students along with researchers active in these disciplines Here the reader will find a strong rationale for maintaining a holistic approach revealing what insights and advantages are retained by the broader perspective and more explicitly by the synergistic effects that cannot be discerned by reducing systems to their smallest parts *Modeling Complex Systems* Nino

Boccara, 2010-09-09 This book illustrates how models of complex systems are built up and provides indispensable mathematical tools for studying their dynamics This second edition includes more recent research results and many new and improved worked out examples and exercises **Model Emergent Dynamics in Complex Systems** A. J.

Roberts, 2014-12-18 Arising out of the growing interest in and applications of modern dynamical systems theory this book explores how to derive relatively simple dynamical equations that model complex physical interactions The author's objectives are to use sound theory to explore algebraic techniques develop interesting applications and discover general modeling principles Model Emergent Dynamics in Complex Systems unifies into one powerful and coherent approach the many varied extant methods for mathematical model reduction and approximation Using mathematical models at various levels of resolution and complexity the book establishes the relationships between such multiscale models and clarifying difficulties and apparent paradoxes and addresses model reduction for systems resolves initial conditions and illuminates

control and uncertainty The basis for the author's methodology is the theory and the geometric picture of both coordinate transforms and invariant manifolds in dynamical systems in particular center and slow manifolds are heavily used The wonderful aspect of this approach is the range of geometric interpretations of the modeling process that it produces simple geometric pictures inspire sound methods of analysis and construction Further pictures drawn of state spaces also provide a route to better assess a model's limitations and strengths Geometry and algebra form a powerful partnership and coordinate transforms and manifolds provide a powerfully enhanced and unified view of a swathe of other complex system modeling methodologies such as averaging homogenization multiple scales singular perturbations two timing and WKB theory

Audience Advanced undergraduate and graduate students engineers scientists and other researchers who need to understand systems and modeling at different levels of resolution and complexity will all find this book useful Modeling Complex Living Systems N. Modeling Complex Systems—Symmetry problems in the Science of Living Systems Nicola Bellomo, 2020-05-29 This MPDI book comprises a number of selected contributions to a Special Issue devoted to the modeling and simulation of living systems based on developments in kinetic mathematical tools. The focus is on a fascinating research field which cannot be tackled by the approach of the so called hard sciences specifically mathematics without the invention of new methods in view of a new mathematical theory. The contents proposed by eight contributions witness the growing interest of scientists in this field. The first contribution is an editorial paper which presents the motivations for studying the mathematics and physics of living systems within the framework of an interdisciplinary approach where mathematics and physics interact with specific fields of the class of systems object of modeling and simulations. The different contributions refer to economy, collective learning, cell motion, vehicular traffic, crowd dynamics, and social swarms. The key problem towards modeling consists in capturing the complexity features of living systems. All articles refer to large systems of interacting living entities and follow towards modeling a common rationale which consists firstly in representing the system by a probability distribution over the microscopic state of the said entities, secondly in deriving a general mathematical structure deemed to provide the conceptual basis for the derivation of models, and finally in implementing the said structure by models of interactions at the microscopic scale. Therefore, the modeling approach transfers the dynamics at the low scale to collective behaviors. Interactions are modeled by theoretical tools of stochastic game theory. Overall, the interested reader will find in the contents a forward look comprising various research perspectives and issues followed by hints on how to tackle these.
