**Nondestructive Testing of Beryllium** Metals and Ceramics Information Center (U.S.), Roger J. Runck, 1974 Radiography with X rays is the workhorse as a method of nondestructively testing beryllium It is especially capable of revealing inclusions and it can detect voids in moderately thick sections Ultrasonic and eddy current tests can be used to supplement liquid penetrant tests for identification of discontinuities near the surface Acoustic emission is a relatively new nondestructive testing technique that has proven to be useful for evaluating beryllium under load and more extensive use of this technique is likely in the future Holographic interferometry has been used to detect strain and thereby identify debonds in beryllium structures However the method is not especially effective with materials having high modulus of elasticity such as beryllium because of the high stresses necessary to produce appreciable strain Modified author abstract
