

# How Are Electromagnetic Waves Used In Non-Destructive Testing And Inspection Techniques?

- Non-destructive testing (NDT) and inspection techniques are essential in various industries for assessing the integrity of materials and systems without causing damage, with electromagnetic waves playing a crucial role
- Eddy Current Testing (ECT) utilizes electromagnetic induction to detect defects in conductive materials, while Ground Penetrating Radar (GPR) employs high-frequency electromagnetic waves to map subsurface structures
- Remote Field Testing (RFT) is used for inspecting ferromagnetic tubes in applications like heat exchangers, by transmitting a low-frequency electromagnetic field through the material
- Infrared thermography, a non-contact NDT method, detects defects by

**Nondestructive Testing Techniques** Don E. Bray,Don McBride,1992-08-07 Based upon several years of extensive research performed at U S government laboratories this reference offers a wide range of techniques involving flaw detection the testing of properties and the integrity of materials in a way which does not impart damage or impair the usefulness of the material Covers visual penetration sonic ultrasonic magnetic electromagnetic penetrant and enhanced visual inspections as

Nondestructive testing enables scientists and engineers to evaluate the integrity of their structures and the properties of their materials or components non intrusively and in some instances in real time fashion Applying the Nondestructive techniques and modalities offers valuable savings and guarantees the quality of engineered systems and products This technology can be employed through different modalities that include contact methods such as ultrasonic eddy current magnetic particles and liquid penetrant in addition to contact less methods such as in thermography radiography and shearography This book seeks to introduce some of the Nondestructive testing methods from its theoretical fundamentals to its specific applications Additionally the text contains several novel implementations of such techniques in different fields including the assessment of civil structures concrete to its application in medicine

**Exploratory Development of Nondestructive Testing Techniques for Diffusion-bonded Interfaces** George Martin,John F. Moore,1969 The report covers exploratory development of nondestructive testing techniques for solid state diffusion bonded parts A literature survey describes the current inspection practices employed on diffusion bonded laminates and the nature of the interface and bond properties Test specimens of titanium columbium and TD nickel were prepared for evaluating various test methods The specimens provided a range of thicknesses and varying degree of bond quality as determined by mechanical property tests In addition a number of diffusion bonded specimens were supplied by the Air Force Conventional ultrasonic techniques and recently developed selective interface inspection techniques clearly indicate bond conditions where these vary from a no bond condition to substandard bonds A number of methods show potential correlation between a quantitative expression of bond quality such as shear or tensile strength These methods include longitudinal and shear wave velocity ultrasonic attenuation and vibration analysis Author

Quality Assurance: Guidance to Nondestructive Testing Techniques United States. Army Materiel Command,1970 *Nondestructive Testing Techniques for Research and Process Control* ,1965 Non destructive test methods have been used primarily for the detection of defects and the rejection of faulty materials The Oak Ridge National Laboratory has found it valuable to employ special non destructive testing techniques as aids in materials research component development and process control This paper gives three recent examples of the evolution of non destructive testing techniques from research to process control A current fuel element design contains fuel pins filled with vibratory compacted uranium and thorium oxide powder A gamma attenuation technique was developed to allow the homogeneity of fuel loading to be measured and was used to aid the development of fabrication techniques and equipment Later an inspection device was built to operate remotely in a hermetically sealed and shielded facility and used for

production process control Another fuel element required fuel plates containing a uranium oxide aluminium dispersion core with a programmed variation in the fuel loading across the width A continuous scanning X ray attenuation technique was developed and used to measure fuel inhomogeneities and conformity to design contour The technique assisted the development for both core pressing and plate rolling practices A system was constructed for rapid automatic evaluation of production fuel plates These fuel plates were pressed into involute shape and assembled with alternate cooling channels Stringent heat transfer requirements imposed a tight tolerance on the channel dimensions A unique eddy current device using the lift off characteristic was invented to insert in the very narrow channel and allow recording of dimensions both during fabrication development and actual manufacture Another approach to fuel elements is the use of minute fuel bearing particles coated with pyrolytic carbon to retain the fission products Of concern are the core diameter coating thickness and integrity and presence of fuel in the coating Development of micro radiographic techniques has provided a powerful tool to evaluate the many variables in the coating process for optimum fabrication Further application allows the evaluation of the effects of service including heat treatment and in reactor testing Results of these studies assist the realistic evaluation of production lots and the recycle of information to correct discrepancies

**Techniques with the Fracture Behavior of ATJ-S Graphite** W. L. Shelton,1972 Selected specimens of ATJ S graphite were nondestructively evaluated and tensile tested in gas bearing test facilities The nondestructive test methods used on billets specimen blanks and finished specimens were visual inspection alcohol wipe radiography and radiographic enhancement techniques Correlations were made between nondestructive test indications and fracture location and strength Low density areas were found to be the predominant weakening defect in this graphite Fractographic examination of the fractured specimens revealed flaws which could be correlated with those flaws detected nondestructively and predicted from Griffith s theory
