Nicolaenko, 1982-01-01 **Nonlinear Problems: Present and Future** **Fusion Energy Update** ,1983 **Energy Research Abstracts** ,1984 **ERDA Energy Research Abstracts** ,1983 *Nonlinear Problems of Elasticity* Stuart Antman, 2013-03-14 The scientists of the seventeenth and eighteenth centuries led by Jas Bernoulli and Euler created a coherent theory of the mechanics of strings and rods undergoing planar deformations They introduced the basic concepts of strain both extensional and flexural of contact force with its components of tension and shear force and of contact couple They extended Newton's Law of Motion for a mass point to a law valid for any deformable body Euler formulated its independent and much subtler complement the Angular Momentum Principle Euler also gave effective variational characterizations of the governing equations These scientists breathed life into the theory by proposing formulating and solving the problems of the suspension bridge the catenary the helix the elastica and the small transverse vibrations of an elastic string The level of difficulty of some of these problems is such that even today their descriptions are seldom vouchsafed to undergraduates The realization that such profound and beautiful results could be deduced by mathematical reasoning from fundamental physical principles furnished a significant contribution to the intellectual climate of the Age of Reason At first those who solved these problems did not distinguish between linear and nonlinear equations and so were not intimidated by the latter By the middle of the nineteenth century Cauchy had constructed the basic framework of three dimensional continuum mechanics on the foundations built by his eighteenth century predecessors **Nonlinear Problems** David R. R. Bednarek, Lamberto Cesari, 1982 **Physics Briefs** ,1992 *Integrable Systems and Applications* Mikhael Balabane, 1989 In this volume nonlinear systems related to integrable systems are studied Lectures cover such topics as the application of integrable systems to the description of natural phenomena the elaboration of perturbation theories and the statistical mechanics of ensembles of objects obeying integrable equations The more physical

lectures center largely around the three paradigmatic equations Korteweg de Vries Sine Gordon and Nonlinear Schrödinger especially the latter These have long been of great mathematical interest and also exhibit a universality which places them among the most frequently encountered integrable equations in the description of physical systems Tidal waves optical fibers and laser beams are among the topics discussed Lectures are also devoted to multidimensional solitons integrability of Hamiltonian systems of ODEs and dissipative systems of PDEs
