Chemical Engineering Thermodynamics Jack Winnick, 1996-11-29 The aim of this contemporary textbook is to show students that thermodynamics is a useful tool not just a series of theoretical exercises Written in a conversational style the text presents the second law in a totally new manner there is no reliance on statistical arguments instead it is developed as a natural consequence of physical experience Students are not required to write complex iterative computer programs to solve phase equilibrium problems techniques are presented which enable use of readily available math packages The book also explores electrochemical systems such as batteries and fuel cells Included in the extensive amount of examples are those which demonstrate the use of thermodynamics in practical design situations

Industrial Catalytic Processes for Fine and Specialty Chemicals Sunil S Joshi, Vivek V. Ranade, 2016-04-12 *Industrial Catalytic Processes for Fine and Specialty Chemicals* provides a comprehensive methodology and state of the art toolbox for industrial catalysis The book begins by introducing the reader to the interesting challenging and important field of catalysis and catalytic processes The fundamentals of catalysis and catalytic processes are fully covered before delving into the important industrial applications of catalysis and catalytic processes with an emphasis on green and sustainable technologies Several case studies illustrate new and sustainable ways of designing catalysts and catalytic processes The intended audience of the book includes researchers in academia and industry as well as chemical engineers process development chemists and technologists working in chemical industries and industrial research laboratories Discusses the fundamentals of catalytic processes catalyst preparation and characterization and reaction

engineering Outlines the homogeneous catalytic processes as they apply to specialty chemicals Introduces industrial catalysis and catalytic processes for fine chemicals Includes a number of case studies to demonstrate the various processes and methods for designing green catalysts **Select Thermodynamic Models for Process Simulation** Jean-Charles de

Hemptinne, Jean-Marie Ledanois, 2012 The selection of the most adequate thermodynamic model in a process simulation is an issue that most process engineer has to face sooner or later This book conceived as a practical guide aims at providing adequate answers by analysing the questions to be looked at The analysis first chapter yields three keys that are further discussed in three different chapters 1 A good understanding of the properties required in the process and their method of calculation is the first key The second chapter provides to that end in a synthetic manner the most important equations that are derived from the fundamental principles of thermodynamics 2 An adequate description of the mixture which is a combination of models and parameters is the second key The third chapter makes the link between components and models both from a numerical parameterisation and physical molecular interactions point of view Finally 3 a correct view of the phase behaviour and trends in regard of the process conditions is the third key The fourth chapter illustrates the phase behaviour and makes model recommendations for the most significant industrial systems A decision tree is provided at the end of this chapter In the last chapter the key questions are reviewed for a number of typical processes This book is intended for process engineers who are not specialists of thermodynamics but are confronted with this kind of problems and need a reference book as well as process engineering students who will find an original approach to thermodynamics
