MPEG Video Compression Standard Joan L. Mitchell, 1996 *MPEG Video Compression Standard* Chad Fogg, Didier J. Le Gall, Joan L. Mitchell, William B. Pennebaker, 2007-05-08 This book initiates a new digital multimedia standards series The purpose of the series is to make information about digital multimedia standards readily available Both tutorial and advanced topics will be covered in the series often in one book Our hope is that users will find the series helpful in deciding what standards to support and use while implementors will find a wealth of technical details that help them implement those standards correctly In today's global economy standards are increasingly important Yet until a standard is widely used most of the benefits of standardization are not realized We hope that standards committee chairpeople will organize and encourage a book in this series devoted to their new standard This can be a forum to share and preserve some of the why and how that went into the development of the standard and in the process assist in the rapid adoption of the standard Already in production for this series are books titled Digital Video Introduction to MPEG 2 and Data Compression in Digital Systems

Hybrid Video Compression Standard Dhaval R. Bhojani,Vedvyas J. Dwivedi,Rohit M. Thanki,2019-09-18 The book presents compression techniques for digital video stream describing their design using various image transforms such as discrete cosine transform DCT discrete wavelet transform DWT and singular value decomposition SVD It first discusses the basic requirements and applications of video compression techniques The book then addresses video compression using DCT as well as the hybrid compression technique designed and implemented using DCT DWT and SVD demonstrating the simulation results for both Lastly it proposes future research directions in the field

Real-Time Video Compression Raymond Westwater,Borko Furht,2007-08-28 Real Time Video Compression Techniques and Algorithms introduces the XYZ video compression technique which operates in three dimensions eliminating the overhead of motion estimation First video compression standards MPEG and H 261 H 263 are described They both use asymmetric compression algorithms based on motion estimation Their encoders are much more complex than decoders The XYZ technique uses a symmetric algorithm based on the Three Dimensional Discrete Cosine Transform 3D DCT 3D DCT was originally suggested for compression about twenty years ago however at that time the computational complexity of the

algorithm was too high it required large buffer memory and was not as effective as motion estimation We have resurrected the 3D DCT based video compression algorithm by developing several enhancements to the original algorithm These enhancements make the algorithm feasible for real time video compression in applications such as video on demand interactive multimedia and videoconferencing The demonstrated results presented in this book suggest that the XYZ video compression technique is not only a fast algorithm but also provides superior compression ratios and high quality of the video compared to existing standard techniques such as MPEG and H 261 H 263 The elegance of the XYZ technique is in its simplicity which leads to inexpensive VLSI implementation of any XYZ codec Real Time Video Compression Techniques and Algorithms can be used as a text for graduate students and researchers working in the area of real time video compression In addition the book serves as an essential reference for professionals in the field

The VC-1 and H.264 Video Compression Standards for Broadband Video Services Jae-Beom Lee, Hari Kalva, 2008-12-18 Probably the most interesting and influential class to the authors about video compression was EE E6830 Digital Image Processing and Understanding at Columbia University in 1995 offered by adjunct Professors Dr Netravali Dr Haskell and Dr Puri at AT T In the class they impressed the authors with how such difficult and mysterious statements in video standards could be interpreted understood in plain human languages Since then the authors had had a dream that similar services could also be provided to interpret difficult video subjects into reasonable level of explanations in the future The VC 1 standard is fundamentally the same as WMV 9 WMV x video compression technologies of Microsoft have long been the most popular over the Internet due to popularity of Microsoft Operating Systems The technologies were published in August 2005 for the first time in a formal SMPTE document in the name of VC 1 and the official standard then was finalized in April 2006 In contrast the MPEG committee recently standardized the MPEG AVC H 264 video coding standard whose first version was officially published in May 2003 and several subsequent amendments and corrigenda then followed until recently These two are highly efficient compression standards that can make hi quality video services possible for Digital Storage Media e g Blu ray DVD or HD DVD and or broadband networks applications e g IPTV

Buffering Techniques for Delivery of Compressed Video in Video-on-Demand Systems Wu-Chi Feng, 2007-08-26 Many emerging technologies such as video conferencing video on demand and digital libraries require the efficient delivery of compressed video streams For applications that require the delivery of compressed stored multimedia streams the a priori knowledge available about these compressed streams can aid in the allocation of server and network resources By using a client side buffer the resource requirements from the server and network can be minimized Buffering Techniques for Delivery of Compressed Video in Video on Demand Systems presents a comprehensive description of buffering techniques for the delivery of compressed prerecorded multimedia data While these techniques can be applied to any compressed data streams this book focusses primarily on the delivery of video streams because of the large resource requirements that they can consume The book first describes buffering techniques for the continuous playback of stored video sources In particular several bandwidth smoothing or buffering algorithms that are provably optimal under certain conditions are presented To provide a well rounded discussion the book then describes extensions that aid in the ability to provide interactive delivery of video across networks Specifically reservation techniques that take into account interactive functions such as fast forward and rewind are described In addition extensions to the bandwidth smoothing algorithms presented in the first few chapters are described These algorithms are designed with interactive continuous playback of stored video in mind and are also provably optimal under certain constraints Buffering Techniques for Delivery of Compressed Video in Video on Demand Systems serves as an excellent resource for multimedia systems networking and video on demand designers and may be used as a text for advanced courses on the topic

An Experimental Analysis of the MPEG Compression Standard with Respect to Processing Requirements, Compression Ratio, and Image Quality Daniel G. Howard, 1997 As computer use and capabilities have grown people have become more interested in being able to create and access various types of multimedia content The MPEG video compression technique provides a method for compressing video content down to a size that computers and networks can handle To properly make use of this algorithm it is necessary to understand the trade offs that exist when choosing among the various options of the MPEG algorithm Background information on the MPEG 1 MPEG 2 and MPEG 4 algorithms is presented This thesis then provides an understanding of the trade offs of applying different compression and decompression options of the MPEG 1 algorithm on various types of video streams This allows recommendations on which options should be used for specific categories of video sequences to be made The performance of an existing implementation of the MPEG compression and decompression algorithm is analysed to determine these resulting trade offs Various types of video

sequences are used to observe the results of changing the various parameters of the algorithm. Some of the parameters that are investigated include the percentage of the I only spatially compressed P forward predicted and B bi directionally predicted frames in the compressed stream and the individual quantization of each of these frames. The results from each of the video sequences when these parameters are modified and analysed with respect to overall CR, compression ratio, play rate, average compression ratio of the I, P and B frames separately, file percentages of the I, P and B frame separately and image quality. Image quality is measured subjectively using results obtained by polling a group of individuals who have observed the various video sequences. The main variables that are dependent on each other are play rate, image quality and compression rate. This resulting trade off analysis leads to a statement on which types of parameter settings should be used in each of the various types of video sequences. In order to complete this thesis, first a working understanding of the MPEG algorithm was obtained. The various video sequences used were collected. The test video streams derived from these base cases were then created and analysed. As part of this analysis phase, a group of individuals viewed and rated these video streams with respect to an original base case. A systematic approach for reporting the effect of changing the MPEG parameters on image quality, play rate and compression ratio was determined. These results are then presented along with suggestions on when to use the various parameter options. Areas for further research are then discussed.

Transporting Compressed Digital Video Xuemin Chen, 2002-03-31 The purpose of Transporting Compressed Digital Video

is to introduce fundamental principles and important technologies used in design and analysis of video transport systems for many video applications in digital networks. In the past two decades, progress in digital video processing, transmission, and storage technologies such as video compression, digital modulation, and digital storage disk has proceeded at an astounding pace. Digital video compression is a field in which fundamental technologies were motivated and driven by practical applications so that they often lead to many useful advances. Especially, the digital video compression standards developed by the Moving Pictures Expert Group (MPEG) of the International Organization for Standardization (ISO) and the International Electrotechnical Commission (IEC) have enabled many successful digital video applications. These applications range from digital video disk (DVD) and multimedia CDs on a desktop computer to interactive digital cable television and digital satellite networks. MPEG has become the most recognized standard for digital video compression. MPEG video is now an integral part of most digital video transmission and storage systems. Nowadays, video compression technologies are being used in almost all modern digital video systems and networks. Not only is video compression equipment being implemented to increase the bandwidth efficiency of communication systems, but video compression also provides innovative solutions to many related video networking problems. The subject of Transporting Compressed Digital Video includes several important topics in particular: video buffering, packet scheduling, multiplexing, and synchronization.
